News Desk

Tony Clarke, Dragon Data's Managing Director designate.

Dragon in forced sale by Mettoy

METTOY, the toy manufacturing giant, has been forced to sell its successful Dragon microcomputer development.

A six-partner consortium has contributed to create a new company, Dragon Data Ltd. The present managing director of Dragon, Tony Clarke, is retained as managing director designate.

Mettoy will continue to hold an 18.61 percent interest in Dragon Data.

In the last three years Mettoy has accumulated losses of more than £11.5m — resulting from the collapse of its toys business. Sale of Dragon — its one profitable subsidiary — is a bitter blow to the company's hopes of an early recovery.

Mettoy realises some £900,000 from the deal, which will go to offset losses in the first nine months of 1982 of over £2.5m.

See page 5

New games machine from Atari

ATARI has launched a new games machine in the US.

Called the Advanced Video Entertainment System (AVES), it was first shown as the Atari 5200 in Chicago in June.

The machine is a development of Atari's present VCS system with 16K Ram and improved graphics capabilities. It can also reproduce speech and a wide range of games sound effects.

Atari spokesman John Dean explained: "Each machine comes with two universal controllers — a combination of joystick, paddle and keyboard. They have 360° manoeuvrability and four firing buttons (two on each side)." The AVES features a pause facility, allowing the game in play to be halted and later resumed.

The machine is now on sale in America and has been launched with the full range of Atari software.

The AVES will be launched in the UK late in 1983. Price has yet to be decided.

100 FREE PROGRAMS
FROM SILICA SHOP — WITH EVERY PURCHASE OF AN
ATARI 400 800

ATARI

ATARI PRICES REDUCED!
We at Silica Shop are pleased to announce some fantastic reductions in the prices of the Atari 400/800 personal computers. We believe that the Atari at its new price will become the U.K.'s most popular personal computer and have therefore set up the Silica Atari Users Club. This club already has a library of over 500 programs and with your purchase of a 400 or 800 computer we will give you the first 100 free of charge. There are also over 350 professionally written games and utility programs, some are listed below. Complete the reply coupon and we'll send you full details. Alternatively give us a ring on 01-301 1111 or 01-309 1111.

ATARI 400 with 16K	**£199**
ATARI 400 with 32K	**£248**
ATARI 800 with 16K	**£449**

400/800 SOFTWARE & PERIPHERALS

Don't buy a T.V. game! Buy an Atari 400 personal computer and a game cartridge and that's all you'll need. Later on you can buy the Basic Programming cartridge (£35) and try your hand at programming using the easy to learn BASIC language. Or if you are interested in business applications, you can buy the Atari 800 + Disk Drive + Printer together with a selection of business packages.

Silica Shop have put together a full catalogue and price list giving details of all the peripherals as well as the extensive range of software that is now available for the Atari 400/800. The Atari is now one of the best supported personal computers. Send NOW for Silica Shop's catalogue and price list as well as details on our users club.

Subscriptions
You can have *Popular Computing Weekly* sent to your home: the subscription rate is **£19.95** per year, for addresses in the UK, **£37.40** overseas.

How to submit articles
Articles which are submitted for publication should not be more than 1,000 words long. The articles, and any accompanying programs, should be original. It is breaking the law of copyright to copy programs out of other magazines and submit them here — so please do not be tempted.

All submissions should be typed and a double space should be left between each line. Please leave wide margins.

Programs should, whenever possible, be computer printed.

We cannot guarantee to return every submitted article or program, so please keep a copy. If you want to have your program returned you must include a stamped, addressed envelope.

Accuracy
Popular Computing Weekly cannot accept any responsibility for any errors in programs we publish, although we will always try our best to make sure programs work.

This Week

Editorial

With Christmas fast approaching, many parents will be wondering what presents to buy for their children. Microcomputers are likely to figure prominently alongside the more traditional train sets, bicycles and toy soldiers.

Children are much more discriminating now than they were even 10 years ago. A micro on which they can play PacMan and Space Invaders is far more attractive than blow football or Monopoly, though it is also more expensive.

The boom in the micro market has to some extent coincided with a decline in the established toy making industry. Meccano is no more and a number of other toy manufacturers are struggling.

A few of the more far-sighted toy companies have already branched out into microcomputers and television games centres. Mettoy set up Dragon Data as a subsidiary and is already reaping the benefits. Mattel has launched its Intellivision system and Phillips has a similar system on the stocks.

The result is likely to be a rise in micro sales in the run-up to Christmas. Equally important, software houses may find there is an increased demand for their programs.

Next Thursday

Can you escape from the Deneb system? How many starships can you destroy? Can you avoid blowing up the universe? Find out in Star Fighter — a new game for the unexpanded Vic20.

Also next week, Tim Langdell presents the first review of the Camputers Lynx — a micro for both home and office.

Other features include our regular Spectrum and Dragon pages, our continuing series on machine code and an interview with Tony Clarke of Dragon.

Your local newsagent needs your support

Your local newsagent can keep a copy of *Popular Computing Weekly* for you. All you have to do is fill in the form below, cut it out and give it to your newsagent.
Please reserve me a copy of *Popular Computing Weekly*.

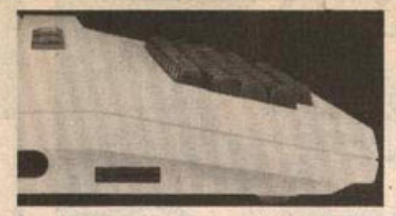
Dragon grows on Prutec diet



SALE of the Dragon venture to a six-partner consortium will enable an ambitious development programme, planned for the machine, to continue.

In the deal, the new Dragon Data Ltd will receive £2.4m in equity and loan stock. Ownership of Dragon Data is split as follows: Prutec (40.74 percent), the Welsh Development Agency (22.12 percent), Mettoy (18.61 percent), National Water Council, Fountain Development Capital Fund and F & C Enterprise Trust (16.53 percent) and Dragon directors (2 percent).

The company plans to produce more than 200,000 microcomputers in 1983 and the cash will be used to fund the necessary expansion. It was this growth that Mettoy could not afford to undertake that prompted the sale.

Dragon will now be moving from the Mettoy factory in Swansea to premises provided by the Welsh Development Agency, possibly near Port Talbot. Within the next few months the number of staff employed by Dragon — currently 60 — will double.

Tony Clark, Dragon's managing director, sees a rosy future for the company. "Dragon has had a very substantial influx of cash and we shall be taking a great deal of manufacturing and distribution skills with us from Mettoy."

At present the printed-circuit boards for the Dragon 32 microcomputer are assembled by Race Electronics in Llantrisant. Manufacture of the cases, assembly of the boards and cases, and quality control are all performed by Mettoy.

Mettoy will continue to manufacture the plastic mouldings for the machine, but final assembly and testing will now be carried out by Dragon Data.

Tony Clarke commented: "By the middle of next year Dragon hopes to be able to assemble 50 percent of the printed-circuit boards. Mettoy will continue to carry out subcontract work for us in the forseeable future — providing their price is right."

The new line-up at the top of Dragon Data will be: Tony Clarke (Managing Director), Richard Wadman (Sales and Marketing Director), Derek Williams (Technical Director) and Morris Wilde (Manufacturing and Engineering Director).

Following the sale, Mettoy, which employs more than 2,000 workers, must consolidate its traditional toy interests in an effort to reduce its continuing heavy losses. Mettoy retains an option to buy back up to 35 percent share of Dragon in 1984-85.

Vic rallies as 64 launch falters

LAUNCH of the Commodore 64 microcomputer has been delayed.

It now looks as if the 64 will not go on sale in the UK until at least the middle of December and possibly not until spring next year.

The Vic20 will not now be withdrawn, as originally planned, and will continue to be sold in the UK in 1983.

More than 1m Vic20s have now been sold worldwide — 800,000 to the US. Jack Tramiel predicts that Commodore will sell a further 400,000 Vics in America before Christmas.

Still waiting, but listening

IN the past, ringing Sinclair's mail-order company in Camberley has rarely been a pleasurable experience.

All that has now changed. A machine has now been installed which plays you music while waiting for your enquiry to be dealt with.

Among the tunes on offer are Ray Charles singing "I Can't Stop Loving You" and Stevie Wonder singing "Sunshine of My Life"

5th ZX Microfair

DECEMBER 18 will see the Fifth ZX Microfair, held once again at the New Horticultural Hall, Greycoat Street, London.

The show will be open from 10 am to 6 pm. For further details contact Mike Johnston, 71 Park Lane, Tottenham, London N17.

Taking a horizontal view

FOR those who find the 32-character width of the ZX Printer restricting, there is now a solution.

Using the software developed by Crommax, it is possible to print lengthways down the ZX Printer paper — rather than widthways. Up to 32 lines can be printed, of whatever length defined by the user.

The program — *ZX Lprint* — is available on cassette, price £3.95 from Crommax, 25 Favart Road, London SW6.

BBC goes Forth

LEVEL 9 Computing has announced a version of Forth for the BBC Models A and B microcomputers.

The rq Forth compiler is supplied on cassette complete with a 70-page manual. A full screen editor is included and 260 primary commands are provided. Further functions can — as is usual with Forth — be easily defined.

The cassette costs £15 and is available from Level 9 Computing, 229 Hughenden Road, High Wycombe, Bucks.

Torch modem approved

TORCH Computers has obtained permission from British Telecom to connect its modem unit to the telephone network.

Based around circuit boards manufactured by Acorn, the Torch computer now becomes the first machine to gain such approval.

Further information is available from Torch Computers, Abberley House, Great Shelford, Cambridge.

Sinclair in vouchers mix-up

CONFUSION has arisen over the £10 discount vouchers being given away by Sinclair Research to purchasers of the Spectrum microcomputer.

Customers who have ordered more than one machine in the same order have complained that they have received only one voucher.

Jaeserv, Sinclair's mail-order company, confirmed this policy. Their supervisor commented: "If more than one machine is going to the same address, then the customer will only receive one voucher."

A spokesman for Sinclair Research explained "The order processing computer generates one voucher per order. If a customer who ordered more than one machine comes back to us — either by telephone or letter — we will send out the balance of the vouchers.

"There is absolutely no intention to deceive," he added.

Rumbelows' aggressive marketing

RUMBELOWS normally sell the Commodore Vic20 microcomputer for £169.99.

But as a special offer they are now selling the machine at £139.99 — providing you part-exchange your old Sinclair computer or tv game. As they say in the advertisement: "What more could you expect from Rumbelows?"

MELBOURNE HOUSE has tied up a deal with the Tolkien Estate to produce an adventure game for the 48K Spectrum featuring characters from the book "The Hobbit".

The planned package will include a copy of the book and will go on sale in December.

LETTERS

Exchange and Mart

I wonder if any of your readers can help me to obtain a copy of *Popular Computing Weekly*, July 1, as I need this to complete my collection of your magazine.

In exchange I can offer a number of my own "video art" programs for the Vic20 with Super expander cartridge.

Customer complaints

About two weeks ago I wrote to you, enclosing a copy of a letter I had sent to Clive Sinclair. In the letter I complained about the ridiculously long delivery wait for the 48K Spectrum together with the constant misrepresentation by Sinclair about the clearance of the backlog. It is now *16 weeks* since my order was acknowledged (which in turn was a further two weeks since it was received). When I rang Sinclair yesterday I was given for the umpteenth time "about another three weeks".

It is therefore disappointing to find that once again you have fallen into the trap of helping to give credence to Sinclair's *FALSE* propaganda. You reported on page 5 of your September 30 issue the claim that the backlog would be cleared by the middle of October. "About three weeks" means, in Sinclair Language, that they really have no idea when delivery will take place. *Even if* it was three weeks, this would still take it to *after* the middle of October.

When you consider that my order was placed at the end of *May* (and there must be hundreds in the waiting list behind me), it is evident that there was never even the *remotest* possibility that the whole backlog would be cleared by the middle of October. While I appreciate that you print in good faith information received by you, it must surely be obvious to you by now that Sinclair's utterances are merely intended to mislead people instead of giving the true position. By continuing to regularly propagate them, you are yourself in danger of alienating a small proportion of your readership.

Michael Hodgkins
3 Rimsdale Walk
Ladybridge
Bolton
Lancashire BL3 4TT

Despite your unfortunate experience, and those of other frustrated Spectrum buyers, I do not think Sinclair's utterances are deliberately intended to mislead people. Sinclair has found itself in its current mess by promising a product which it subsequently found it could not deliver within the stated 28 days.

There are a number of reasons why Sinclair is unable to deliver the Spectrum on schedule, mainly technical. Since the beginning, we have reported on the problems Sinclair has had with quality control, the additional 32K Ram and most recently the redesign of the Spectrum's printed circuit board.

Sinclair has issued a number of statements on delivery times for the Spectrum. Unfortunately, further production problems have meant further delays.

Sinclair is aware of the damage these delays are causing to his reputation, and the fact that he is losing customers to competing manufacturers.

If it is any consolation, the backlog for 16K machines does seem to be shortening. It is largely the 48K customers who are reporting horror story delays of 16, 17 and even 19 weeks.

And he pulled out a plum

Nigel Searle says that Sinclair has tried to respond with letters to aggrieved customers but that it was very difficult.

Rubbish!

Further, Sinclair has spent an absolute fortune in customer service.

Spherical objects!

Facts: Since ordering a 48K Spectrum in May, by Teledata, I have received only two letters from the company. Neither letter was at all reassuring, helpful or informative and the postal charge, 31 pence, is hardly a fortune. Now, some 4½ months later, I still await delivery of the machine despite numerous telephone calls to Camberley.

Small wonder, then, that I am inclined to get annoyed by talk of the delays being over, of the backlog being cleared, of excuses like "we didn't think", factory holidays, minor production problems. Small wonder, then, that Trading Standards Offices up and down the country have Sinclair on their complaints files, that the Advertising Standards Authority is investigating, that other consumer interests, including the Office of Fair Trading, are becoming involved.

Sinclair may be a "technology driven company". However, if the company is to remain in business it needs to considerably improve its flagging public image, to improve its appalling customer service record, both for new sales and for repairs of faults.

Mr Sinclair, I suggest, needs to pull his finger out!

Amplifying Spectrum

I have discovered a very simple method of amplifying the sound output from the ZX Spectrum. All you need is your tape recorder and cassette leads, no expensive add-ons are required. Simply plug in the microphone lead and disconnect the earphone lead, then remove the tape from the recorder and press the play button. All the sounds made by the Spectrum's internal speaker will now be echoed at the recorder's speaker and you can adjust the volume and tone controls. There is some background noise caused by the recorder itself, but what do you want for nothing? I use a Prinz TR 225 recorder.

On a different subject, you announced in the October 14 edition of *Popular Computing Weekly* that Prism are building a new range of software for the ZX81. Could you please tell me how to get in touch with them?

A Laird
9 Franklin Road
Saltcoats
Ayrshire KA21 5AT

Prism Microproducts is based at 30-31 Islington Green, London N1 8BJ (Telephone 01-359 7481).

Antipodean's pleasure

Came across your magazine while browsing about the local newsagent.

Being the owner of a ZX81 (with 16K memopak) I promptly purchased the magazine, went home and thrashed into the programs there-in.

What joy to see so many goodies aimed at the ZX81 computer. Most software available here is aimed at the "other mobs".

I have ordered all the back issues, and will continue to collect the future ones. Keep up the excellent standard won't you?

PS. Letters from readers would be welcome.

Reinventing the wheel

In the correspondence with W. McLaren and his cube root program, you are reinventing the wheel. Uncle Clive has given us a direct routine for cube or any other roots. Just swot up on the laws of indicies and use "to the power of" key (shift H).

```
10 INPUT Y
20 PRINT Y**(1/3)
30 GOTO 10
```

The general statement is Y** (1/n) which will give the nth root of Y.

Y**−n will give you the reciprocal of Y^n or $\frac{1}{Y^n}$

Y**(−1/n) will give the reciprocal of $\sqrt[n]{Y}$ or $\frac{1}{\sqrt[n]{Y}}$

This facility will also confirm the truth of the statement $Y^0 = 1$, a result which could be disconcerting in the middle of an equation and may prompt some users to complain about a faulty Rom.

If you have an opinion you want to express, or have spotted an error that needs correcting, write to: Letters, Popular Computing Weekly, Hobhouse Court, 19 Whitcomb Street, London WC2.

Radio Log

A directory program for 16K ZX81 by Anthony Briggs

One of the requirements of the amateur transmitting licence is that you should keep a permanent written log of all radio contacts, complete with dates, times, callsigns, wavelengths, etc.

Many amateurs, however, keep in addition, a separate card index of contacts so they can tell quickly if a contact is a fresh one. QSO was designed as a computer 'card index' which would allow me to:

(i) Check to see if a callsign was already logged.
(ii) Enter it if necessary with appropriate details, name, town, latest date of contact and other information.
(iii) Modify entries as necessary.
(iv) Enter a 'backlog' of callsigns at one go.
(v) Print a sorted list of all entries.

QSO is designed for 150 entries, but the only limitation on this, and the size of the entries, is the memory available.

To enter, type in the program as listed. Run is to set dimensions. When the menu appears, type in 'L'. This is the 'hidden' code which lists the program when you wish to break it. Now, delete lines up to, but not including 100.

To use the program type in *Goto* 100.

The program can be *Saved* from the menu, complete with entries and will Run automatically on *Loading*.

NB. Although QSO is designed for radio enthusiasts, it can easily be adapted for anyone who wants an index program.

Neil Hooper with his array of signal processing machines.

From the Bachelors to Bug-Byte and Bach

***David Kelly** talks to Neil Hooper of the Tape Duplicating Company*

Every prospective software company has come up against this problem at some time or another. You have just written the best computer program on the planet. Now what do you do with it?

If you want to sell it, it will need to be copied. There are surprisingly few companies that have the facilities to produce large quantities of computer cassettes — one of these is the Tape Duplicating Company, based in Islington, London. They handle work for many of the major companies and November will see them produce close on ¼m software cassettes.

Yet, it is only by a series of happy accidents that they have come to be involved in this type of work at all.

Neil Hooper runs their computer division. After leaving school he joined Barclays Bank. Posted to Cross Keys in South Wales he soon became restive. Moving jobs, he worked first as a disc jockey at Tiffany's in Rotherham and then as a writer for the IPC *Melody Maker* spin-off *Musicians Only*. This job only lasted 18 months before the publication folded, and he found himself without work.

Neil lived quite close to Tape Duplicating. He just wandered in one day and they offered him a job on the strength of his knowledge of the music-business.

At this time Tape Duplicating did no computer work. That side of things started in November 1981. Explains Neil: "John Patterson of Silversoft just came in off the street and said 'Do you copy microcomputer cassettes — I found you in yellow pages.'

"My first reaction was enthusiastic. It was just luck. I was, at that time, the only person in the company who was a micro-computer enthusiast. A friend on *Musicians Only* had introduced me to his Tandy Level 1, and ever since then I had been hooked. I told John that we'd have a go."

At this point there were no ground rules for duplicating software cassettes. Up until then the UK home computer market had been a cottage industry.

"The ZX81 was our entry," says Neil. "People we talked to said if you could get less than a 25 percent rejection rate then you were doing well. This horrified me. I thought 'If we can't do better than that then we don't want to know.' "

Cutting out and loading.

Neil agreed to do some trials with the tapes supplied by Silversoft and the results were encouraging. This was in November in the height of the audio season and everything was jumping for Christmas 1981. So any further plans were shelved until the New Year. In January the company bought a ZX81 and a Ram pack.

"When we looked at whether we wanted to get into computer tape duplication we discovered that we were ideally set up to do it," says Neil. "We had the right equipment — purely by chance. With very little adjustment we could improve our tolerances to the necessary levels. If we hadn't been able to do it so easily I don't suppose we would have got into it — now is not the right time to start a huge investment in machinery — particularly then, for a market which at that time did not even exist.

"These days we do quite a lot of signal processing to ensure the quality of our recordings, and our record is pretty well perfect. Now that the market is increasingly retail orientated, our customers have to be sure we will do a good job because quite often the tapes go straight into distribution after leaving our factory.

"We do work for most of the well-known companies, 51 in total — including Quicksilva, Bug-Byte, Commodore, Sinclair and Grundy. So far we have done 226 cassette programs, of all types — games, business packages and utilities. But we had another four masters in this morning. The equipment we have means we can cope with programs for the ZX81, Spectrum, Vic20, Dragon, NewBrain, Commodore 64, Tandy, Sharp and almost anything else. We can do the Atari, but it is a small market since most of the software is Rom based."

Tapes are copied end-to-end, recorded many times on reels of cassette tape over 1½ miles long. The recorded reel is then cut into the cassette cases after recording. This is better than in-cassette copying, where recording takes place after the tape has been loaded into the cases. The recording takes place at many times the normal playing speed and in-cassette copying is of inferior quality because the cassettes are not designed to operate smoothly at high speeds.

Computer tape duplicating brings its own special problems. But it does have the advantage that the frequency range of the computer signal is in a narrow region — up to 3 or 4 KHz (a typical audio signal could be as high as 16KHz.) A disadvantage is that the tape quality has to be high. Tape drop-out — small imperfections in the magnetic coating of the tape — which would be tolerable on an audio cassette, are unacceptable on a computer tape.

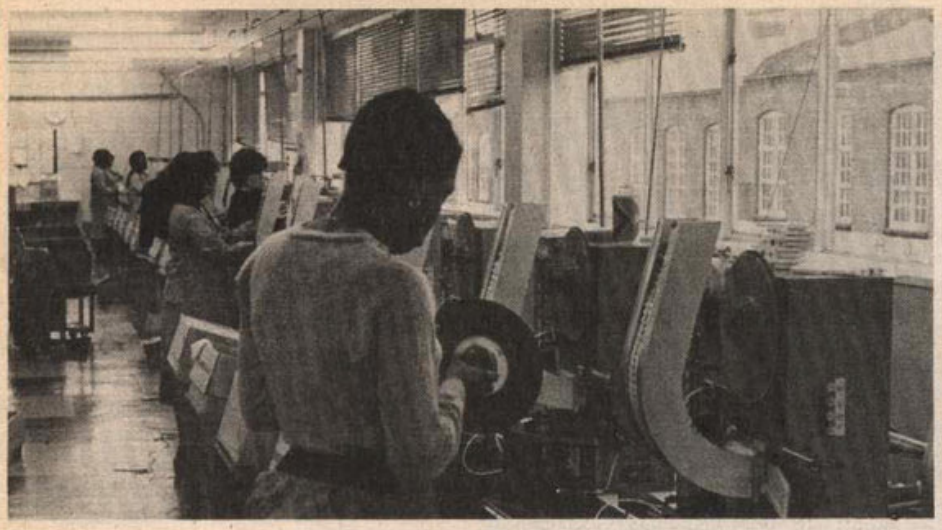
The duplicating process has nine steps:

(1) Signal processing. The computer program is dumped from the tape supplied by the software house on to ¼" tape.

At this stage the signal is processed so that, after duplicating, the wave-form will be suitable to allow easy loading of the program. Domestic recorders are often badly aligned, so the loading process must be made as uncritical as possible.

(2) Mastering. The ¼" tape is copied on to a 1" master.

(3) Master loop. The 1" master is formed into an endless loop by joining the ends together. The 1" loop is loaded into 1 of 5 master recording units and is driven round at 240" per second. The output is then used to record on to the cassette tape. A typical computer program master is run through the master unit's play heads once every 5 to 10 seconds. Each time the join in the tape comes round a small audio blip is transferred on to the cassette tapes



Loading the empty cassettes.

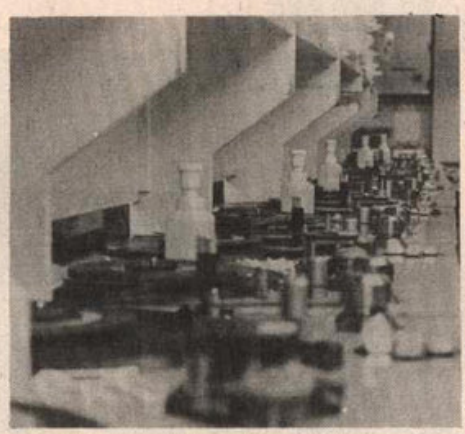
being recorded — this is the cue tone.
(4) Recording. The output from the master recorder is transferred to up to 14 slave units. These carry the cassette tape in the form of "pancakes" 8,500 feet long. The cassette tape is run at 64 times the normal playing speed and more than 150 duplications are made every minute.
(5) Checking recording. From each batch of pancakes recorded, the final one is checked to ensure that the slave has been correctly set-up and the recording level is verified.
(6) Checking loading. This last recording from the pancake is then cut out into a cassette case and the loading characteristics of the tape on the computer are checked.
(7) Cutting out. If these two quality checks are passed the pancakes are taken downstairs to be cut out into the cassettes. Here the tape from the pancake is married with what are called C0s — cassettes containing only leader. The leader is drawn part across the cassette, is cut, and one program length off the pancake is spliced and wound in. The sections are cut off the pancake using the tones (put on by the gap in the master) to determine the beginning and end of each recording.
(8) Printing. The completed cassettes are stamped with the name and details of the program.
(9) Packing. Finally, the cassettes and card inserts are placed inside the cassette boxes.

Most computer cassettes are either C6 or C10 cassettes (3 or 5 minutes per side). It costs 33p plus VAT per C10 cassette duplicated, with a minimum order of 500 units. For orders of less than 1000 there is a small charge for mastering and for printing on to the cassette. The minimum charge is then £207 with a turn-round time of 4 to 5 days.

Tape Duplicating does not involve itself in the printing or production of the loose card inserts or packing. In many cases the packaging costs more than the cost of the cassette and duplication.

"In January this year," says Neil, "we were duplicating perhaps 1000 computer cassettes per month. This November we are booked up to produce 240,000 units. This will be our first software Christmas.

"Duplication of computer cassettes now takes up more than 10 percent of our work. The *Personal Computer World* show was ridiculous — we are still getting a flood of orders as a direct result of our being there.



Recording on a bank of slave units.

"The reason is that software is the key to a machine's success. Without software a microcomputer will not sell. Look at the Dragon for example. So many people are writing for that machine that its future looks assured. We have something like 15 companies that hope to do Dragon cassettes through us at the moment.

"Confidentiality is obviously very important. Most companies who launch a new machine want some software to be released at the same time. Consequently, we get a pretty good picture of what everybody is planning for the next six months. So obviously secrecy is vital to our continued business and good relations. That puts us firmly on the inside of the industry and — quite incidentally — helps us to plan what we should be doing.

"We have constantly to keep an eye open for pirates. So far we have only had one case of someone else's tape being presented to us for duplication and in fact it turned out to be perfectly legitimate. There are so few good programmers that it has reached the point where I can recognise their styles — and tell who wrote a program just by looking at it — like a fingerprint.

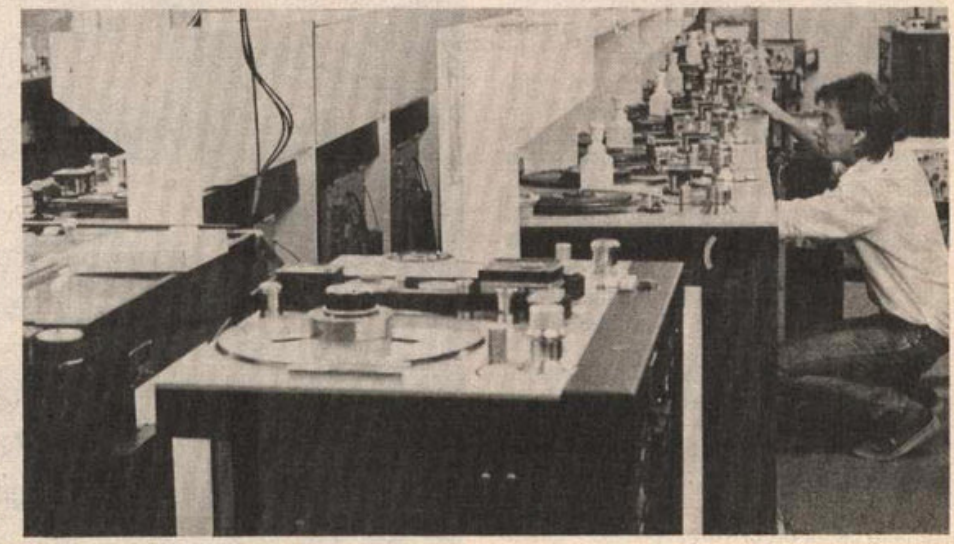
Piracy

"Piracy of our own cassettes is something we cannot really stop — we can make copying difficult — but not impossible. But it will only become a serious problem when the pirated copies start being marketed in any real quantities. This is almost certainly starting to happen.

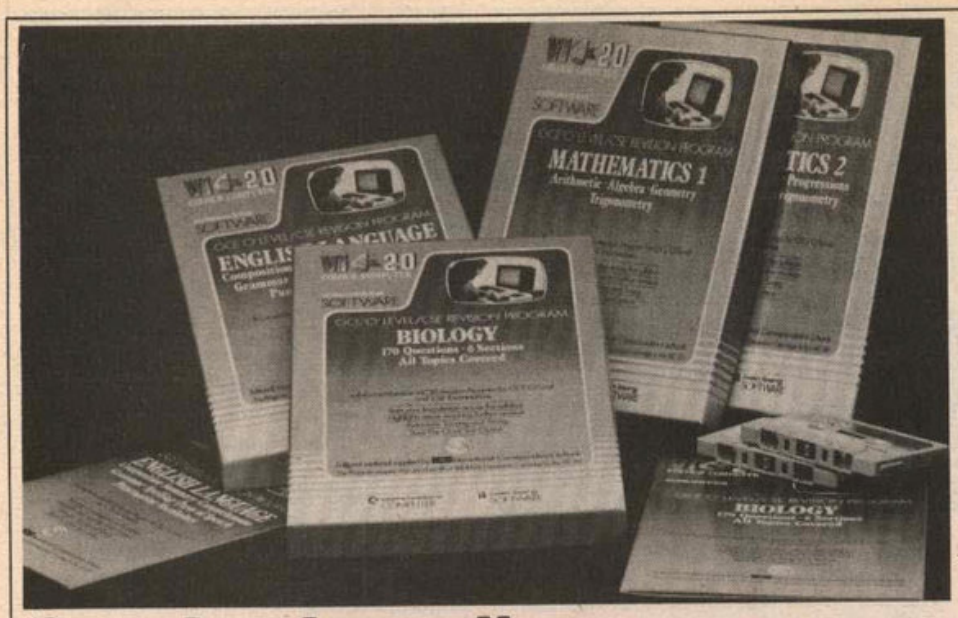
"We are also exporting more and more material. A lot of Vic cassettes go overseas and more and more of our ZX81 titles also say TS1000. $1.00 per tape is the figure that I have heard quoted for tape duplication in the US and our prices are competitive with that.

"Quite what will happen to the UK market is still very uncertain. Hopefully, the current boom will carry through to February next year as people buy software for the machines they received at Christmas.

"It is such a new market that there is no established seasonality yet — the machines haven't all arrived — the Lynx and Oric are still on their way and who knows about the Binatone — and the structure of the market hasn't settled down. I hope it will by next year. Staying one jump ahead is wearing me out.



Master loop (foreground) used to record on to slave units.



Capping 'em all with Mastermind

***Mike Grace** cuts his teeth on three of Commodore's latest Vic20 programs.*

The introduction of the microchip into the home has received considerable publicity. While the computer hobbyist still buys his machine primarily to learn programming or play games, there is still a vast untapped market of people who do not want to spend all day zapping asteroids or munching blue meanies and who are just a little bit frightened of the idea of a machine that talks back — yet feel perhaps there will be a future for a computer in their home.

This market is big money, when compared with the hobbyist. There comes a stage when the appropriate software needs to be created to persuade this market to part with its money and purchase the hardware. Educational programs might seem to be the answer, satisfying the justification for Dad to actually buy that machine, which he hopes he will have time to play with, because he can persuade everyone that it is a *good thing* as it will help the children to learn more.

Commodore has come up with some new programs with fairly toned down covers, unlike the more lurid and eye-catching games, which are aimed specifically at the educational application of the Vic20. There are two main varieties at the moment — the GCE Revision programs, including subjects such as English Language, Biology, Physics, Chemistry and Mathematics and the Home Software range which includes quizzes and games for the family and subjects like Money Manager (the often-maligned cash-flow/bank balance program) and the Robert Carrier Family Menu Planner (the cookbook database).

All the programs are cassette-based, all require either 8K or 16K expansion, and all are neatly packaged in strong cardboard boxes which contain a superbly-written booklet plus two cassettes tidily contained in plastic and easily removed from their packaging. The boxes open with a hinged lid. I was impressed with the style and quality of the packaging which, for the price (£9.99), seemed to be well above average. Ten pounds seems to be good value for money when compared with most other software around. But is it value for what you get?

The three programs I was sent for review were *Mastermind, Quizmaster* and *English Language Revision.* As all were basically the same in performance, I will start by describing *Mastermind* in some detail and then compare the other two.

At this stage I should point out that all these programs come from the combined talents of Commodore and the Ivan Berg Software house. I hope that this 'marriage' continues, as I believe there is tremendous scope for the future. However, I also feel there are some flaws in the existing concepts which I shall come to in a moment.

Mastermind looks the most appealing program and I thought would be the best of the three, with a picture of the famous Mastermind chair on the cover of the box

Ivan Berg with Vic20 and Commodore/Ivan Berg software.

and the weight of the BBC behind it. On opening the instruction booklet there is a short introduction plus an even shorter summary of the game itself, for anyone living in a cave who may not be familiar with the idea.

The instructions really are excellent, assuming absolutely no knowledge of how to load programs yet displayed in a manner that allows the seasoned player to skip swiftly through the elementary advice. For each major segment of the loading instructions there is a clear photograph of the screen display. All my children dealt swiftly and easily with this section.

As I mentioned these programs are cassette-based, and it was here that I found the first problem — the loading time. In the booklet mention is made of this with the rather glib statement that the 1½-2 minutes it takes to load "adds to the tension and excitement." It might work with the first game, but after that it becomes tedious. While it makes sense to produce cassettes for the mass market, it would be nice to incorporate into the program the facility to save on disc both the main program (which of course you can if you have your own disk drive) and the data.

Once loaded, the Vic blurts into life by playing a short snatch of electronic music. Although the book told me this was the well-known Mastermind theme, I could not recognise it. Still, it only lasts about three seconds. And then we are into the game itself.

The idea is to copy the television game. The Vic takes the part of Magnus Magnusson and asks the questions. Each player must type in his answer and get through as many questions as possible in two minutes.

"I found the level of questions difficult to assess . . ."

There are several other data types available which allow participants to select topics such as Sport and Games, Music, Films and TV as their specialist subjects. The introductory kit comes with a tape which contains Science and Technology on one side and General Knowledge on the other. As the game is designed for up to four players, it would seem advisable to purchase the extra tapes. At £1.99 for each tape the cost of a complete package comes nearer to £26 (there are eight extra data tapes at the moment).

Quizmaster follows the same format as *Mastermind,* but this time you can construct and set your own questions. Once again there is a main operating cassette which loads the program, and a data tape which contains a sample test quiz to show how it is done. But you also have the option of entering a menu which will allow you to devise, set, edit and save your own quiz. And this time the total cost is £9.99.

In all these quizzes there are three main types of questions, a multiple choice, true or false, or matched answer. As you devise your own quiz you are free to select any of the three types. The Vic asks you to set the question, type the answer and select an appropriate score out of 100. With each quiz you have a maximum of 40 questions (which is no problem as I found it quite difficult to think of 10 at first). Having started on the quiz, you can save it at any stage and come back to it later.

What appealed to me about this program was that I could set whatever question I liked. For example, I have already created a quiz to test my five-year-old on his spelling and his multiplication tables.

The problem with *Mastermind* was the lack of sufficient data. Quite often the same question would be randomly thrown up during the same game — giving one player an unfair advantage. To be fair we were playing with the one data tape and so were quite restricted, but this is a definite snag.

In *Quizmaster* there is a clock display ticking away the seconds as you go through the quiz, but this is missing from the screen in *Mastermind.* Quite a serious omission from the excitement of the game I would have thought.

The final program I tested was the GCE *English Language Revision.* Obviously this time the questions are more specialised and the knowledge of a slightly higher standard. The booklet gives what I can only describe as short notes of guidance (difficult to see how to fit in the entire GCE syllabus in 5½ pages). The questions seemed to be very limited in scope as they are based on the notes in the booklet.

I found the level of questions difficult to assess as I am not a teacher, but I can imagine it would be a useful adjunct to a child who was finding a certain subject quite difficult. For most children, however, I feel it would have only limited value.

In summary then, I am pleased that Commodore is launching into the expanded software scene. All three programs were well written, well presented and appeared bug-free. Each game comes with one cassette containing the operating software recorded twice on each side of the tape (surely a slight overkill of the belt and braces concept) in case of loading problems. *Mastermind* is the best game in the light of family playing, but I feel is overpriced for the scope available. However the cost of £2 a cassette for more data seems very reasonable. The GCE revision program is also well presented but requires self-discipline. At £10 I think it is good value if your child finds that topic difficult, as it does make learning a little more enjoyable, but if your child is good at the subject I suspect it would quickly pall.

For my money *Quizmaster* is easily the best of the three. It contains simple advice on how to set up your own quiz, which can be as easy or hard as you wish, cover whatever topic you choose, act as a game for the family and allows you to change the data whenever you want.

My biggest complaint about all the programs was their inherent ability to bring home to me just how ignorant I am. It is perhaps a little distressing to find *Mastermind* has given me 3 out of 20 questions right. In fact, I think I'll just collect the family together again and we'll have another game . . .

Open Forum

Open Forum is for you to publish your programs and ideas.
It is important that your programs are bug free before you send them in. We cannot test all of them.
Contributions should be sent to: Popular Computing Weekly, *Hobhouse Court, 19 Whitcomb Street, London WC2H 7HF.*

How to contribute

Each week the editor goes through all the programs that you send to Open Forum in order to find the Program of the Week.

The author of that program will qualify for DOUBLE the usual fee we pay for published programs. (The usual fee is £5.)

Presentation hints

Programs which are most likely to be considered for the Program of the Week will be computer printed and accompanied by a cassette.

The program will be well documented, the documentation being typed with a double spacing between each line.

The documentation should start with a general description of the program and then give some detail of how the program has been constructed and of its special features.

Listings taken from a ZX Printer should be cut into convenient lengths and carefully stuck down on to white paper, avoiding any creasing.

Please enclose a stamped, self-addressed envelope.

Screen $

on ZX81

This is a machine-code version of the ZX Spectrum's *Screen* $(Y,X) function for the ZX81.

My function returns the code of the character situated at Y,X on the screen. With this function basic versions of games such as Pacman can be reproduced with a more realistic running speed. Also Spectrum games containing *Screen* $(Y,X) may be converted to the ZX81.

To use the function in your programs type in program A and run it. Now delete all but line 1. Now type in program B and the rest of your program. When you wish to find the contents of Y,X just *Gosub* 9000 and the answer will be in L.

For those just learning machine-code I have included a detailed list of how the code works. This function takes about 1/50th of a second to complete.

ADDRESS	*HEX CODE*	*INSTRUCTION*	*BASIC*
16514	00	—	X stored here
16515	00	—	Y stored here
16516	218240	LD HL,16514	LET HL = 16514
16519	4E	LD C,(HL)	LET C = PEEK HL ie LET C = X
16520	0600	LD B,0	LET B = O so BC = X
16522	2A0C40	LD HL,(D.F)	LET HL = PEEK 16396 ie HL = start of Memory Map
16525	23	INC HL	LET HL = HL + 1 ie first square on screen
16526	09	ADD HL,BC	LET HL = HL + BC ie LET HL = HL + X
16527	E5	PUSH HL	Store HL
16528	218340	LD HL,16515	LET HL = 16515
16531	5E	LD E,(HL)	LET E = PEEK HL ie LET E = Y
16532	1600	LD D,0	LET D = O ie DE = Y
16534	210000	LD HL,0	ie LET HL = O
16537	0621	LD B,33	LET B = 33
16539	19	ADD HL,DE	LET HL = HL + DE ie HL = HL + Y
16540	10FD	DJNZ −1	if B < > O then LET B = B −1 and go to 16539 ie Multiply Y by 33
16542	44	LD B,H	LET B = H
16543	4D	LD C,L	LET C = L
16544	E1	POP HL	LET HL = HL that was stored
16545	09	ADD HL,BC	LET HL = HL + BC ie HL = HL + (33 * Y)
16546	4E	LD C,(HL)	LET C = PEEK HL so C contains code of character at Y,X on screen
16547	0600	LD B,O	LET B = O
16549	C9	RET	RETURN

On *Return* from machine code *Usr* 16516 = contents of BC so *Let* L = *Usr* 16516 means *Gosub* 16516 and *Let* L = BC, but BC = code of character at Y,X on screen so L = code at Y,X on screen.

High-res characters

on Dragon

This short routine displays the character set which is available in each high resolution mode on the Dragon. The screen is filled with each character before the next character is displayed.

Program notes:

Lines	
10	Reserves space for the machine code routine.
20	Clears the screen then sets the start address for the machine code routine.
30 to 40	The routine to display the character is poked into storage.
50 to 80	These lines alter the high resolution mode and the colour set.
100	The machine code routine.

A description of the machine code routine is given below:

Lines	
86 00	LDA #0 — Pick up first character to be displayed.
8E 00 00	LDA #0 — Load index reg X with offset 0.
A7 89 06 00	STA 0600,X — Store the character at offset X from the top of the screen.
30 01	LEAX 1,X — Increment X by 1.
8C 18 00	CMPX #1800 — Is the screen full.
25 F5	BLO −11 — Loop until 4 pages full.
4C	INCA — Increment character.
26 EF	BNE — Continue until all characters have been displayed.
39	RTS — Return to the calling program.

```
 10  CLEAR 100,16383
 20  CLS : S=16384
 30  READ X
 40  IF X <> -1 THEN POKE S,X : S=S+1 : GOTO 30
 50  FOR PM=1 TO 4 : PMODE PM,1 : PCLS
 60  FOR SC=0 TO 1 : SCREEN 1,SC
 70  EXEC 16384
 80  NEXT SC,PM
 90  END
100  DATA 134,0,142,0,0,167,137,6,0,48,1,140,
          24,0,37,245,76,38,239,57,-1
```

Attenuators

on ZX81

Attenuators is a program which requires about 1,400 program bytes of memory on a ZX81. The program calculates and prints the results in table format of resistive attenuator networks, which are a basic part of any physics 'A' level course.

In practice t- and pi-network resistive attenuators or matching pads (Fig 1) are designed to give some convenient voltage ratio, which may be stated in decibels even though the input and output impedances are different. The attenuation figures in decibels used in the program are those equivalent to 20log (Ein/Eout).

Each type has its subtle advantages and disadvantages. The pi-type for example, will dissipate power through all three resistors in case of no load, the t-type only through two resistors.

Attenuators giving more than 20dB loss and pads with high Rin/Rout ratios are usually built up of two or more basic networks in cascade.

For each pair of cascaded pads, make sure the output impedance of the first network is the same as the input impedance of the second network. Where a more permanent connection is intended, the two adjacent elements may be combined in a single resistor to form a ladder network as shown in Figs 2 and 3.

Any number of steps may be used in order to build up the required attenuation. For balanced networks the values of the series elements are half those for the basic t- or pi-attenuator, as shown in Fig 4.

If for a certain calculation with unequal Rin and Rout negative resistor values are obtained, then the chosen Rin/Rout ratio is too high. Try cascading to achieve the desired impedances. Run program and enter data as asked for on screen. If lists are longer than screen can hold, press *Copy* for a permanent record and press *Cont* for the rest of the results.

This is a very convenient way to interpret and check the results before they are printed. On the other hand one could change the *Print* statements from line 160 through to line 430 and obtain immediate hardcopy by inserting *Lprint* statements.

Line 470 prevents the program list being displayed after each *Run*. If higher than 1 ohm resolution is necessary the real values for R1, R2 etc would have to be printed instead of integer values.

Program notes

Line(s)	
0 to 140	select t- or pi-network. Enter input and output impedances. Enter table limits.
150	speeds up calculations.
160 to 270	print appropriate headings.
280 to 290	define table parameters in *For-Next* loop.
300	decibel conversion.
310 to 370	t-pad formula.
380	prints rounded integer value t-pad results.
390	part of t-pad table loop.
400 to 420	pi-pad formula.
430	prints rounded integer value pi-pad results.
440	*Next* table loop.
450	prevents loss of sync on new data entry.
460	program stops, press *Cont* for new calculations and results.
470	starts again with data entry.

USE AND LEARN

16/48K CASSETTE SYSTEM

VOL.1: 25 BASIC PROGRAMS AVAILABLE NOW

USE

25 PRACTICAL BASIC programs you can put to work immediately–

Programs to demonstrate the wide-ranging potential of your 16 or 48K Spectrum:—

World Atlas — Cassette and Videocassette Index — Music Composer — Computer Term Glossary — Star Maps . . .

Personal Programming Aids to help you write your own programs more effectively:—

Memory Map Monitor — System Diagnostic — Program debugging aids . . .Time-saving routines to use in your own programs:–

Text Editor — Flexible graph drawing routines — Sort and Search routines . . .

Plus much more.

And, of course, original games to entertain and challenge you.

£9.95

LEARN

New ways to get the most from your Spectrum. Over 100 pages packed with —

Powerful programming techniques:— use Structured Programming to save time and make your programs more reliable — Ideas to make your games more exciting — How and when to use trees, tables, sorts and searches (do you know the Monkey Puzzle sort?) . . .

Facts at your Fingertips:— Memory and runtime Benchmarks for every command — Display File Memory Map — Important PEEK and POKE locations you won't find in your Spectrum manual. Program Design Aids:–Screen Designers, for fast graphics and print layouts — Memory Manager, to keep track of every variable and array. PLUS:– All 25 BASIC programs explained line by line –a goldmine of practical hints and tips.

Send today for USE AND LEARN Volume 1– 25 BASIC Programs, and we'll also keep you posted with details of further important MiCROL products for your Spectrum. And, of course, USE AND LEARN comes with MiCROL's full 14-day money-back Guarantee.

To order simply complete the coupon, and FREEPOST with your cheque, made payable to **MiCROL** (UK Mail Order). Allow 28 days for delivery. **Telephone orders**—credit card holders can order by telephoning **(0223) 312866** from 9-5.30 Monday to Saturday, stating name and address, Card No. Access/Barclaycard/Visa. and item(s) required.

Attenuators
by D. Fritsch

World Map

on Vic20

This program produces a map of the world in high-resolution graphics for the unexpanded Vic20. I think that it really does show all Vic owners what their basic machine can do considering the limited amount of *Ram* that it has.

The program plots a map of the world with a title printed above it which takes up about half of the screen.

The program is written in three parts and starts off with the setting up of the high-resolution screen; then comes the main body of the program consisting mainly of *Data* statements for the X,Y co-ordinates of the display and finally the point-plot subroutine.

The program starts off by copying all of the characters that are necessary for the display from *Rom* to *Ram* memory locations which start at 6144 and go up to 7679; this is so that any changes that have to be made to the characters for the display can now be made (characters cannot be touched while in *Rom*). Memory pointers are also set in this line (line 10) by *Poking* 52,24 and 56,24. This is done so that the character information now comes from *Ram* where the copied characters are stored.

Line 15 prints the title and sets the screen and border colours. Line 20 lays out the high-resolution area of the screen by *Poking* the characters from 64 to 191 on to the screen. So that the title could be printed the characters from 0 to 63 were also copied into *Ram* (these are the normal letter characters etc). The title was only included in the display to show the use of both high-resolution and ordinary characters on the screen at the same time.

The next thing that the program does is to turn all of the characters which are to be used for the display, ie 64 to 191 'off', that is, to set their memory locations to zero. This is done in line 25.

The next part of the program consists mainly of *Data* statements for the X,Y co-ordinates for the subroutine at lines 200 to 210. These lines calculate which memory location requires changing and then *Pokes* that memory location so that a 'pixel' is turned on (there are 8 × 8 pixels in every character).

The program takes about three minutes to complete the display because it is run in Basic, so to speed up the program it is best run with machine code subroutines (if memory space allows). The user of the program can delete all of the lines from 30 to 199 which leaves him with about 1800 bytes to write his own program which plots whatever he likes as long as he is within 127 × 63 on the X,Y co-ordinates (size of high-resolution area).

Asteroid Lander

on BBC Micro

The object of the game is to plant your planet's flag on the planet Zaxon. Zaxon, however, has a moving asteroid belt close to its surface, which must be negotiated to achieve a safe landing. You must land in the centre of the landing pad, which is located at the right-hand side of the screen. If you do land, the flag will automatically drop from your ship's cargo hatch. You will then take off again, and you must reach the top of the screen to complete your mission safely. This program will run on a BBC microcomputer, model B.

Program notes:

Lines	
90	Switches the cursor off.
100	Sets up the asteroid positions.
600 to 630	Makes a sound when you land.
660 to 850	Checks to see if you have hit an asteroid.
890 to 920	Makes an explosion sound if you crash.
1150 to 1370	Prints the instructions.
1420 to 2010	Moves the asteroids.

ZX81 HEWSON CONSULTANTS ZX SPECTRUM

20 BEST PROGRAMS FOR THE ZX SPECTRUM
By Andrew Hewson **£5.95**
Mr HELPLINE — the man who answers your ZX queries in his column in *Sinclair User*, the author of HINTS & TIPS FOR THE ZX80 and HINTS & TIPS FOR THE ZX81 now presents his 20 BEST PROGRAMS FOR THE ZX SPECTRUM.

* 20 original programs for you to load into your Spectrum.
* 20 interesting programs for you to enjoy and learn from.
* 20 great programs for you to teach you about fixed and variable length records, binary searches, bubble sorts, floating point arithmetic, graphic displays and much, much more . . .

Program Titles Include:

Machine code editor — Write, modify, extend and load machine code using this all-Basic machine code editor. No need to use an Assembler when you have this program.

Index file — Learn about fixed length records, save numeric and string fields, add to, sort, modify, delete and print your records. Ideal as a computer based card index.

Duckshoot — Learn how to manipulate the attribute file *and* have fun at the same time.

Diary — Binary searches and variable record lengths are explained with this useful and interesting program.

PLUS: FOOTBALL, DIGITISER, DATA PLOT, FUNCTION PLOT, REGRESSION, HISTOGRAM and many more . . .

Cassettes

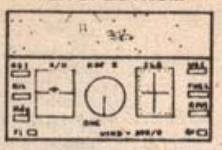
SPACE INTRUDERS **£5.95**
ZX81
PROGRAMMERS TOOLKIT **£6.50**
ZX81
PROGRAMMERS TOOLKIT for the 64K **£6.50**
ZX81
STATISTICS **£3.75**
ZX81
LANGUAGE DICTIONARY **£3.75**
ZX81
NAVAL BLOCKADE **£4.95**
ZX81
MACHINE CODE EDITOR **£4.95**
ZX SPECTRUM
MUSIC & SKETCH **£4.95**
ZX SPECTRUM

LINE RENUMBER £4.95

PROBABLY THE MOST USEFUL UTILITY PROGRAM for the ZX81
LINE Renumber is a full machine code Program which resides in ½K above Ramtop, leaving you 15½K to load your own programs into. At your command, Line Renumber will renumber your program including the destination lines of GOTO's and GOSUB's (line numbers only). Line Renumber is available for use with 16 and 64K memories. Please specify which you require (64K version resides at 8192).

NIGHTFLITE £5.95

ZX SPECTRUM



NIGHTFLITE PUTS YOU AT THE CONTROLS OF A LIGHT AIRCRAFT FLYING AT NIGHT. YOU CAN:

● CLIMB ● DESCEND ● TAKE OFF ● LAND
● BANK LEFT OR RIGHT
● NAVIGATE BETWEEN BEACONS
● RAISE/LOWER THE FLAPS
● RAISE/LOWER THE UNDERCARRIAGE
● ADJUST ENGINE RPM
● RAISE/LOWER THE NOSE VARYING AMOUNTS

Runway lights appear on approach. 5 modes including Autopilot. **Written by a qualified light aircraft pilot.**

Z80 OP CODES £1.45

A must for the beginner and the experienced programmer alike. This hand ready reckoner lists all 600 plus Z80 machine code instructions in decimal and hexadecimal with their mneumonics. Each Op Code is succinctly explained and cross-referenced. Supplied in a protective transparent wallet for easy reference and durability.

PROGRAMMERS TOOLKIT £6.50

The Programmer's Friend and Slave! Are you writing your own programs for the ZX81? How can you do that without our Toolkit? It will encourage you to go on to write bigger, better and more sophisticated programs by doing your donkey work.

Simply create 3K of space above Ram top and then load the Toolkit in the normal way. The Toolkit hides above the Ram top awaiting your command. You can now load existing programs from cassette for the Toolkit to operate on. Or type in a wole new program!.

Toolkit functions include:

* RENUMBER including the destination lines of GOTO's and GOSUB's.
* START and Finish lines and Step size specified by you.
* DELETE part or all of a program at your command.
* REPLACE character(s) or token(s) with an equal number of others specified by you.
* EDIT to create subroutines at a stroke by moving blocks of basic program lines.
* FIND a basic program string specified by you.
* INPUT prompts for a two digit hexadecimal code and pokes it in at a specified address.
* Separate version available for 48 + 8 and 64K memories (resides at 8192).

PUCKMAN *NEW!* £5.95

* All action display
* Scour the maze for food
* Dodge the ghosts who come to devour you
* Automatic option — the machine plays itself
* Full keyboard display
* Full instruction display
* Continuous scoring
* Beat the best score to date
* Super graphics when used with Quick Silva graphics board

PILOT ★ £5.95

New and exciting.Pilot challenges you to take off, fly between beacons, then land whilst watching wind speed and dodging craggy mountains — either could lead to disaster! If you take the challenge, you may soon learn to fly solo — so detailed are the flying instructions. Coast along in Autopilot — just to gain confidence, then battle your way through 6 further modes, 6 different ways of trying to steer your plane safely back to base, increasing in difficulty, testing your skills. Good luck with your fight against the unpredictable elements!

AS SEEN ON THE BBC COMPUTER PROGRAMME

WHY BUY THE BBC MICROCOMPUTER?

Only this machine has the massive endorsement of the Department of Education for use in all schools, of the BBC itself through its Computer Literacy Pages, and above all in the BBC TV series on Computer Programming.

The BBC Microcomputer also boasts Expansion Capabilities unparalleled in any other home computer.

Why buy from Data Exchange?

As an authorised distributor, we have large stocks available now, in time for Christmas, and the new BBC Computer Programming series in January.

Don't be disappointed, ORDER NOW, from **DATA EXCHANGE**

Price list including VAT:

BBC Model A	**£299.00 (+ £5.00 p+p)**
BBC Model B	**£399.00 (+ £5.00 p+p)**
Cassette Player	**£34.00 (+ £2.00 p+p)**
Sekosha Printer	**£245.00 (+ £4.00 p+p)**

Beebstick — all leads included
Prices include post and packing.

SOFTWARE
Free Invaders game with each machine purchased.
Full list available on request.

POC 2

Save it for a rainy day

***John Durst** completes his article on memory saving techniques.*

Storing a character in the recognised ZX character code often uses a good many more bits than are required to store the actual information. For instance, the figure "1" has a code, 29, — which is 0001 1101 in Binary. This uses five of the eight bits available, whereas you only *need* to code one bit, 0000 0001, which has the value "1".

By looking for these *values*, rather than the characters for each digit, you can always code for two digits in one byte, and sometimes for three. There are 256 possible characters. So you can code "123456" as, "CHR$ 12, CHR$ 34, CHR$ 56", which only uses three bytes, instead of six. To get the number out of the code, you get the ZX to print the appropriate *Codes*.

But you run into a snag when you try a practical application, like a telephone number. To ring *Popular Computing Weekly* you have to dial, "01 839 6835". If you code this, as I've described above, you will probably come up with, "■B▗"?▮. But when you de-code it, you get, 18396835. You have lost the spacing which makes the number easier to remember, and, more importantly, you have lost the leading zero, so that the STD dialling is up the spout.

What we need is a system which will keep all the zeros and preserve the spaces in their proper place. In fact, we need a system which counts in 11s, rather than in 10s — digits 0 to 9 = 10, plus "space" = 11. We can still get two sets of digits into a single byte, because 11 × 11 is only 121, which is well within the limit of 256.

So much for the theory, but what about the practice? Well, Figure 3, lines 10 to 90 give a simple Basic program, which will code the numbers and spaces into two halves of a single byte. The de-coding, once again, is more handily done with machine code as listed in figures 1 and 2.

The coding is split into two sections, because the first part is identical with the machine code given in last week's article. Its purpose is to locate the beginning of *Z$* among the variables. You should have your coded number ready in *Z$*. The second part of the code will work out the number, spaces and all, and print it.

The first part of the code has been set up as a subroutine named *Findz$*. This subroutine is called at the beginning of the main *Usr* routine.

You will have to enter the machine code in columns 2, 3 and 4 exactly as listed, using the Hex loader I showed last week. Remember to allow enough blobs in the Line 1 Rem statement, to make room for the machine code. You should have at least 39.

Once you have entered the machine code, you can add lines 90 and 100 and Run the program. Enter the telephone number of your choice, press *Newline* and "Hey presto!" out comes the coded version of the number, with the de-coded number underneath.

In a practical program, you would probably store the coded numbers in an array. Then you would have to arrange to dig them out and get them into *Z$*, using a line such as *Let Z$ = B$ (J)*, immediately before the *Rand Usr* 16531.

If you want, you could incorporate the Mr & Mrs program, given last week, into the same block of machine code. To do this you should load another Cd 82 40 immediately after the 18 ED, which will call the *Findz$* subroutine again. Follow this with the second half of last week's listing, starting at 06 02 AF.

When you want to call this routine, you should use *Usr* 16553. You would then need 55 spaces in Line 1 Rem to make room for the machine code for the two programs.

Dwelling on Ragnarök

***John Scriven** gives a few hints and tips on writing structured programs.*

Some of the points I am going to raise will no doubt irritate a number of you, outrage a few, and unfortunately confuse others. I hope that somewhere in the gloom, this article may help you to think about the programs you write and at least prevent you from passing on your faults to others.

Before I start, there are two important points — (1) I have been guilty of most of the following faults myself, and in moments of weakness still fall prey to them, and (2) there are no such things as perfect programs, only those that suffice until a better version comes along.

When writing a program, the first thing to do is switch off your computer, go away and find yourself a piece of paper. Naturally you need to know which computer you are writing for, both its potential and limitations, but actually composing at the keyboard is not the best thing to do. This is a terribly difficult habit to break and only became easy when I realised that I could sit in a pub or on the beach and continue to program.

Sketch a rough design for the program on paper. These questions may help — what is its purpose? Who will use it? Does it need instructions to run? Does it need graphics, sound, etc?

At this stage, it is a good idea to work out a flow of control through the program. You do not need to use standard flow-chart symbols unless you wish to. As an example, I will write a program to demonstrate to primary school-children how to build up a curve from straight lines (curve stitching, as it is more usually called).

RUN → INITIALISE → INSTRUCTIONS → MAIN PROG. → REPEAT?

Attending to the needs of the user first is called the *Outside-In* approach (although many people do not use these rather fiendish terms, you may come across them in text-books).

Now you need to sort out the flow of control in terms of line numbers, then use them to help organise your program. One way is to have a control module at, say, line 1000 and subroutines at, for instance, 2000, 3000, etc.

Designing a program using a modular approach is often called the *Top-Down* method, a term borrowed from psychology (Note that these methods are not mutually exclusive, but that the best bits of each are combined).

In the example program, it produces a result like this:—

```
1000 REM Control Module
1010 GOSUB 2000 : REM Initialisation
1020 GOSUB 3000 : REM Instructions
1030 GOSUB 4000Main Program
1040 GOSUB 5000 : REM Repeat Option
1050 GOTO 1020 : REM Repeat Chosen
```

In effect, the program has now been written — it only need the subroutines to be filled in. You may have subroutines that perform particular functions already on cassette, in which case it is comparatively simple to merge them with new programs. If you do not happen to have any subroutines handy then it is necessary to sit down with some paper and work some out. It is only at this stage that you need to switch on the computer and try them out.

First, the subroutine that handles initialisation. If you state somewhere *Let A = X*, then you should have assigned a value to *X* previously. Some machines assign a default value, usually Ø, to undefined variables, but the Spectrum will produce an error message telling you at which line you have attempted to use the undefined variable.

If you use a subroutine to initialise variables and also label them using Rem statements, rather than dot them about as and when they occur, you can see at a glance which ones you have used previously and what their purpose is. It should be clear that you do not necessarily know these subroutines at the development stage of your program, so set up the first line and add to it when ready.

```
2000 REM Initialisation Module
2010 LET A = 1, etc.
```

The curve stitching program needs no initialisation as such, so it can simply be used to set up the colours of the border, paper, and ink, etc.

To design the main program module, try sketching a few lines on paper to show what the display should be like. On a Spectrum, there are 256 × 176 points you can define, so a piece of graph paper with at least 26 × 18 squares may be a help.

How will the display be built up? It is possible to define each line on the screen one at a time, but this is wasteful on memory and hardly elegant. If you know the starting position for each line and the step size, it is better to use a *FOR – NEXT* loop. Many programs that appear in magazines could be improved a great deal by use of loops. A brief example of a character generator may suffice:

```
10 POKE USR "a", 128
20 POKE USR "a"+1,56
30 POKE USR "a"+2,23
40 POKE USR "a"+3,45
50 POKE USR "a"+4,14
60 POKE USR "a"+5,10
70 POKE USR "a"+6,20
80 POKE USR "a"+7,128
```

```
10 FOR N=Ø TO 7
20 READ X
30 POKE USR "a"+N,X
40 NEXT N
50 DATA 128,56,23,45,14,10,20,128
```

The curve stiching main module can be trimmed by using a loop to generate lines from all four sides of the square at the same time. Note that the program lines are spaced 10 lines apart. Even on a machine with a renumbering facility, it is useful to be able to insert lines you need at a later stage.

The repeat module is fairly simple. If you offer someone the chance of restarting the program, you can use an *Inkey$* function to check for a certain response from the keyboard. This successfully error-traps the user response — any other key press apart from *Break* is ignored.

If this program is to be used by anyone apart from yourself, it needs documentation, ie notes on how to run the program, what it does, how to change it, memory requirements, etc. This information can be on paper, or it can be present in a limited form inside the program.

As this program may be used by young

from page 24

children, or people of limited experience, I decided to make it auto-running, so it is saved using *Save* "STITCH" *Line* 1. The program will execute itself when it has finished loading, and go straight to the instructions. This method is useful on two counts — firstly, it makes it easier for inexperienced users, and secondly, if you hold any information in variables or arrays, they are not lost accidently by using *Run*.

When information is displayed on the screen, it is impossible to know how long the user will take to read and assimilate the display. It is clearly then, an unwise decision to specify a particular length of time to hold the display. All that is necessary is a line such as:—

```
INPUT "Press RETURN to continue": ZS
```

The last module, the repeat option, could be included in the main program but makes more sense as a separate module. Instructions for key pressing should be specific rather than general, ie it is better to say "Press "Y" to continue" than to say "Press any key" (on the Spectrum, as well as many other machines, it is necessary to check for a lower case "y" as well as the upper case).

It can be seen in the listing that I have included the opportunity to *Stop* the program at this stage. There is nothing more infuriating than discovering that the only way to escape is to pull out the mains plug.

The program is now almost finished (sighs of relief), and a check through the listing should show how the flow of control operates. The final touches are a title at the beginning and an author/date line. Note that all Rem statements are nested between empty Rem lines, eg:

```
10 REM
20 REM *CURVE STITCHING*
30 REM
```

This does nothing more than to make the modules stand out.

If you are interested in encouraging good programming practice or hope to go on to more structured languages, like Pascal, Comal or even BBC Basic, you will find the leap into the unknown less painful by adopting a more systematic approach. Since Dijkstra's famous article, "*Goto* statement considered harmful", back in 1968, many people have commented on their over-use in Basic — OK so the program works, but can you still see why a month later?

You may disagree with much that I have written, but I hope it will make you think next time you consider writing a program.

Generating coded ends

We call this the *standard ending*. So we might as well make the program generate this code at the end of the routine automatically. Here's the loader in its simplest form (in 1K you can save memory by shortening the *Print* phrases):

```
10  PRINT "BASE ADDRESS:□";
20  INPUT B
30  PRINT B
40  PRINT "NO. OF DATA BYTES:□";
50  INPUT D
60  PRINT D
70  FOR I = 0 TO D - 1
80  POKE B + I, 0
90  NEXT I
100 LET A = B + D
110 PRINT "CODE:"
120 INPUT C
130 IF C < 0 THEN GOTO 180
140 PRINT C
150 POKE A, C
160 LET A = A + 1
170 GOTO 120
180 CLS
190 FOR I = 1 TO 9
200 POKE I - 1 + A, M (I)
210 NEXT I
```

The last three lines assume that the array *M* has been set up in command mode (ie without line numbers) by:

```
DIM M (9)
LET M (1) = 62
LET M (2) = 30
LET M (3) = 237
LET M (4) = 71
LET M (5) = 253
LET M (6) = 33
LET M (7) = 0
LET M (8) = 64
LET M (9) = 201
```

These are the standard "end of routine" codes mentioned earlier.

Or, you could input these values into *M* using a *For* loop, and then delete the loop before saving. Either way, do not forget to execute the program with *Goto* 10 and not Run, so that the array values are preserved

Now, execute the program:

```
220 LET Y = USR (B + D)
```

The *Y* value returned by *Usr* isn't usually needed, but it has to be there to satisfy the syntax of the statement. It actually contains whatever was in the *Bc* register pair on returning from the machine code routine.

Finally, we look at the state of the program and its data:

```
230 FOR I = B TO A + 8
240 PRINT I, PEEK I
250 NEXT I
```

Now, to run the program. Firstly, the machine code routine has to coexist with the Basic system. If we're careless, Basic will clobber our defenceless little routine, because it's always moving things around in memory.

One way out of this problem is to fool Basic into thinking that the top of memory is below where it really is, and use the resulting "attic" for any programs we want preserved. To do this, *Poke* the bytes 16388 and 16389 (which together form a system variable called *Ramtop*) with the address from which we wish to start our program. In other words, this is the first address which is unavailable to Basic. As usual, the low byte contains the least significant value.

So, taking an example for a 1K machine, *Ramtop* contains the hex value 4400 to start with. If we want to allocate a 256 (decimal) byte attic, we have to set *Ramtop* to 4300:

```
POKE 16388, 0      [=00 hex]
POKE 16389, 67     [=43 hex]
```

Incidentally, 4300 hex=17152 decimal, and you can omit the *Poke* 16388 unless, for some reason, you've changed it from its usual 0 value previously.

Now we type *New* because Basic only notices that *Ramtop* has changed when *new* is executed. Next, load the "loader" program and run it. In response to its *base address* request, type 17152, and, to *No. of data bytes,* type 1. Finally, key in the machine code (62, 4, 6, 7 etc) terminating with a negative value — a delimiter that is ignored on loading but signalling "end of code listing".

The system responds by printing the contents of bytes from 17152 onwards. In 17152 is 11, which is the sum of 4 and 7. This should not be surprising, since that is where we asked to store the result, and it's also the byte we allocated for data. The rest of the "memory dump" just confirms that the program is correctly stored.

Experiment, by altering the values being added (just *Poke* new values into 17154 and 17156 and *goto* 220). Alternatively put the result somewhere else — say 17153. See how it changes the program?

If you have any machine code subroutines/tips/games, please send them to: Machine Code, *Popular Computing Weekly,* Hobhouse Court, 19 Whitcomb Street, London WC2 7HF.

Temperament and the Dragon

***Simon Owen** looks at the pros and cons of being a Dragon owner.*

This article is mainly dedicated to all those people who, like myself, spent hours hunched over that little black box — namely the ZX81, and who now own or are thinking of becoming owners of that miraculous, if slightly temperamental creature — the Dragon 32.

Oh, what a lovely sight that Dragon is, too. A real keyboard at last. Much more thumping of the dead 'touch sensitive' one on the ZX81 and I would have had no finger ends left. The high resolution graphics are super as well after those chunky 64 x 32 things.

But — and it is a very large but at that — the manual, which claims to be comprehensive, certainly does not live up to its promise. It is not a patch on the Sinclair one which is witty and very useful. A first-time user would have a lot of difficulty making the machine do anything at all. As it is, it took me ages to make any sense of it.

A week and a half and nearly a head of hair later, I read that this new animal of mine is really a well-known colour computer in Dragon's clothing. With this information ringing in my brain I begged the money from Mum and off I dashed, hotfoot, to the High Street to buy 'their' manual. I arrived home triumphant with this book, which at £3.95 was great value, almost as good as the ZX81's. It covers in detail (a word I do not think the people at Dragon Data know) all the graphic and some of the string functions, except for two which still have me baffled — *Get* and *Put*.

The first difference between our dear old 81s and the Dragon becomes obvious the minute you turn it on — the screen is smaller than we eighty-oners are used to, Another difference, and quite a good one (I think), is the *Print@* command instead of good old X and Y.

When listing a long program the screen size can be a nuisance. You have to be very quick to stop the listing going off the top of the screen. However, the *Renum* command is great. All that time spent editing line numbers, etc, can now be done in a second. I had great fun with that one. The *Edit* command, which is a bit daunting at first (and which seems to have foiled several reviewers), can be very useful and time-saving once you get the hang of it. And it is much more comprehensive than the edit capability of the ZX81.

The colour commands, which, incidentally, I found quite hard to handle, have one large drawback. The screen text can only be black on green or vice-versa. Although the screen can be *Cls-ed* any colour, the text reverts back to black and green (at least it does for me — any advice to make it otherwise would be welcome). Also, if you use a black and white television, as I have to most of the time, the colours, which should show up as graduated shades of grey — don't.

The only other major gripe I have about the Dragon has to do with the way that the character set is laid out. Although there are approximately the same number of pixel characters as on the ZX81, they are reproduced eight times — each in a different colour. This space could have been used for much more useful things, user-defined characters or pre-defined high-res graphics, to name but two. Also, the fact that these characters are not available through the keyboard but only by using *Chrs* makes programs considerably longer if you are using a lot of low-res graphics.

On the plus side is the fact that all the Dragon commands are amazingly fast compared with the time things take on the ZX81. Even the graphics commands *Line* and *Draw* are almost instantaneous and the circle command is superior to the equivalent on many of the more expensive micros.

Dragon Data's software is not as good as I thought it was going to be. There is not much of it, and what there is does not seem to exploit the machine as well as it could. If you do not have any joysticks there is at least one of their programs you cannot use, but it does not tell you this anywhere on the outside of the packaging. The price of the software seems high at £7.95 when you consider some of the really excellent ZX81 tapes for under a fiver.

Although I seem to be criticising my Dragon a lot, I am being a bit unfair. The Dragon 32, with its 6809 microprocessor, is a totally different type of computer to the ZX81 and most of my moans are more to do with this fact and my own inexperience than from any fault in the machine. The opinion of others far wiser than myself seem to bear out my original impression that the Dragon really is a wonderfully powerful machine with terrific potential. When other enthusiasts and the software houses discover the Dragon there will be ample information and lots of games to play. When this happens I am sure that our Dragons will really prove their worth.

Below are two small 'sample' programs to amuse you. The first produces circular patterns using height/width ratio in conjunction with a *For-next* loop. The second uses the *Line* command to produce everlasting patterns — be warned, this is quite hypnotic!

```
5   REM OVALS
10  CLS
20  INPUT "INCREMENT STEP (1-9)";A
30  INPUT "A NUMBER BETWEEN 1 & 3(DECIMALS TOO)";B
40  PMODE4:PCLS:SCREEN 1,1
50  FOR X=1 TO 90 STEP A
60  CIRCLE (128,96),X,,B
70  NEXT X
80  A$=INKEY$:IF A$=""THEN 80
90  GOTO 10
```

```
1   REM PATTERNS
2   '
3   PMODE 3,1
10  PCLS3
15  SCREEN 1,0
20  FOR I=3 TO 7
25  FOR J=2 TO 6
30  FOR S=0 TO 3
35  FOR R=0 TO 3
40  COLOR R,S
45  A=0:B=255;C=0:D=191
50  LINE (A,C)-(B,D), PSET,B
55  A=A+J:B=B-J:C=C+I:D=D-I
60  IF A<255 AND C<191 THEN 50
65  NEXT R
70  NEXT S
75  NEXT J,I
80  GOTO 30
```

Is there anything about your computer you don't understand, and which everyone else seems to take for granted? Whatever your problem *Peek* it to Ian Beardsmore and every week he will *Poke* back as many answers as he can. The address is *Peek & Poke, PCW,* Hobhouse Court, 19 Whitcomb Street, London WC2 7HF.

INTERROGATION ENGLISH STYLE

R Watson of Washington, Tyne and Wear, writes:

Q Do you know of any way in which tokenised line numbers and commands in the BBC model B program can be converted into English for interrogation and edit aid?

A This can be done if you load the accumulator with the token that you want to be printed. When this is done call the address B53A (hex). The computer will decrunch the token into *Ascii* and then print out the *Ascii*.

ACE GOES BACK TO SCHOOL

Joe Laine of Yew Road, Stockport, writes:

Q I am very interested in the new Jupiter Ace, but I am unsure whether or not to buy it. I was going to get a ZX81 or Spectrum to learn on, because I am going to start learning computing at school soon. What I want to know is, will I have to learn two languages, one at school and one on a Jupiter Ace? Also will there be software coming out for the Ace? I do not want to buy a computer that has no software.

A The Jupiter Ace has caused quite a lot of interest, and not a small amount of decision taking. It is not an easy choice to make if you want to buy a computer, even if you do believe that Forth is a better language than Basic.

What you say about school is very important. I know that last year the London Board specified any high level language for the O-level, but only Basic for the A-level. This year the AEB has not specified Basic only. The thing to do in this case is to talk with your teachers, find out what the syllabus asks and what they are going to teach. While an increasing number of staff are becoming computer literate, I doubt if many of them are conversant with Forth.

I feel that it is a very good choice for a second machine. As to whether you should make it your first choice — I would again suggest you talk to your teachers before deciding.

BASTARDISING BASIC

D G Callow of Hamilton Crescent, Brentwood, Essex, writes:

Q I hope that your series on machine code is going to be as helpful as it looks. I wonder if you could clear up the following points for me.

(a) Why do authors attach so much importance to safeguarding machine code by placing it in a Rem statement, or above Ramtop? After all, I am not going to press *New* until I have finished with the program.

(b) Why is a machine code program so often supplemented by a Basic program. Why cannot the whole program be written in machine code?

(c) Why is it that, having *Loaded* a machine code program, a Basic program then disappears?

(d) Machine code is typically Run by a *Rand Usr* address, but why on earth is *Randomize* necessary?

(e) With all due respect to Messers Stewart and Jones, why do you write a program in Hex, when as part of the *Loading* process it is converted to decimal. Why not write the program in decimal in the first place?

A The reason machine code is placed in either a Rem statement, or above Ramtop, is that the memory locations within a program move. As new information is put in or changed, the addresses of the various items within the program change as well. This does not really matter in the execution of a straightforward program. But, when there is a machine code routine to be called, the computer must know where it is. The first line of a program, or the space above Ramtop are fixed, and therefore safe places to store such a routine.

When you switch on a computer, the Rom takes over and offers you control. Because the Rom is in Basic, the control is in Basic. On the ZX81 machine code can only be 'entered' by commands from the Basic. The second reason for mixing machine code with Basic is that machine code is a lot harder to debug. So, there is often an element of compromise, as it makes fault finding so much easier to identify and correct.

When you use the *Usr* command it also clears the screen. This is why your basic will disappear.

Rand is used because it is a one byte command and relatively harmless in that all it does is to reset the seed generator. Because of the way the ZX81 is configured, *Usr* cannot be called on its own. *Print* could be used, except that it will clear the screen when used with *Usr*, which might not be wanted. *Poke* can also be used, but that starts changing locations. *Rand* is safe and uses the minimum of memory.

The reason that hex is used so often is that it is much simpler. All the addresses from 0 to 65535 can be represented in hex by just four characters. It is also much easier for a computer to convert hex to binary, and vice versa, than it is to convert either of those two to denary.

It is a legacy from the days when computers only had a hex keypad, because of space restrictions (who remembers the Sinclair Mk 14, complete with 256 bytes of Ram and delivery problems?). Also, because there are fewer digits to input, it is quicker to input hex.

COMMON CADS UP MARKET

Paul Mottram of Brompton, London, SW5, writes:

Q I have seen written down sometimes the words CAD and CAM. I'm sure that they are initials for something but cannot work out what. Can you tell me.

A CAD is Computer Aided Design, and CAM is Computer Aided Management. They are words that are very common further up the business end of the market. The most famous examples of CAD are the framework graphics that can be rotated in all directions, whilst maintaining their true perspective.

CAM is more concerned with financial analysis, long-term planning and marketing. Indeed, it would cover most of the work that is dealt with by middle and senior management.

SWITCHING OUT ON MEMORY

Tony De Souza of Elspeth Road, London SW11, writes:

Q After reading your answer in the September 23 issue, about the 80K extension for the Spectrum, I thought I had my questions answered. However, a couple of extra questions have come to mind.

Can I retain the memory that is switched out? And can other hardware still be used, or will it interfere with the expansion? Would it be possible to review the expansion?

Also my Spectrum has a Nand gate wired in, presumably to clear up a problem. Can you tell me what that bug is or was?

A You can retain the memory of the 'switched out' 32K. There is no interference as such from the board as it is an internal fitting. However, the board does have two Leds that stick out the back. I doubt they will stick out enough to interfere with anything that is interfaced to the user port.

The problem that does seem to have occurred is with the actual amount of memory that is switched out. This is done in two 32K blocks, which are somewhat large. Also it means that when you switch out a block your variables and display file go with it. It would seem that some software for downloading the files from the top of the memory to the bottom is needed. I do not at the moment know if this is being done.

As to your last point, if you look at issues 6 and 9 of *Popular Computing Weekly* you will find out that in the original Spectrum pcbs, there was a shared data bus that caused a lot of problems.

If you want to make the most of your **Spectrum** you *must* have this book.
Published in association with *Popular Computing Weekly.*
Send cheques/postal orders, for £5.95, to The Working Spectrum, *Sunshine Books,* Hobhouse Court, 19 Whitcomb Street, London WC2 7HF.
Please allow 28 days for delivery

1K IS NOT ENOUGH!

A 2K ZX81 gives about 3 or 4 times the program area compared to a 1K. If you are running out of memory, this is the cheap answer.

Send £6 for chip plus instructions. Most ZX81's need only a chip swap and one link soldered — a ten minute job. (Some early ZX81's had 2x½K RAM chips instead of 1x1K. These involve more soldering. If you think you have one of these, please specify).

T.E.C., 23 Dalford Court, Hollinswood, Telford, Salop.

16K SPECTRUM programmes wanted of exceptional quality for early marketing. High royalties paid. Educational tapes welcome. Cassettes to MICROJUICE, 46 Ainger Road, London NW3.

THE WORKING SPECTRUM

A LIBRARY OF PRACTICAL SUBROUTINES AND PROGRAMS

By David Lawrence

ONLY £5.95 inc p&p

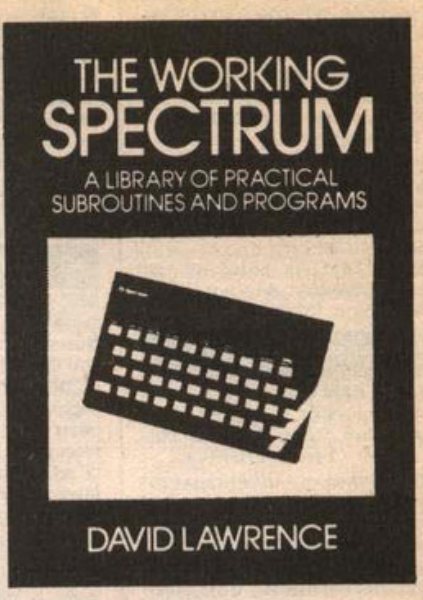
Fed up with books full of trivia, simple games programs and notes which assume you have all the time in the world to experiment.

This book is different. It is based on a collection of solid, sophisticated programs in areas such as data storage, finance, calculation, graphics, household management and education.

Each of the programs is explained in detail, line by line. And each of the programs is built up out of general purpose subroutines and modules which, once understood, can form the basis of any other programs you need to write.

Advanced programming techniques spring out of the discussions explaining each subroutine. The result is not only to advance your programming skills but also to leave you with a wide range of practical applications programs which might otherwise only be available to those prepared to buy cassettes or those capable of writing substantial programs for themselves.

The Working Spectrum is published by Sunshine Books, in association with Popular Computing Weekly.



Please send me a copy of The Working Spectrum.

I enclose a cheque/postal order for £5.95.

ROMIK SOFTWARE

24 Church Street, Slough SL1 1PT. Telephone: Slough (STD 0753) 71535

ROMIK PROMISE A MINIMUM OF ONE NEW GAME EVERY MONTH

Britain's leading games software house are proud to announce our new range of exciting games and other software for the Vic20. (Games for BBC, Dragon, Spectrum and Atari available soon.)

ALL ACTION GAMES CARRY A FREE ENTRY TO NATIONWIDE COMPETITIONS WITH FANTASTIC PRIZES
ALL PROGRAMS ARE £9.99

MARTIAN RAIDER

For unexpanded Vic20

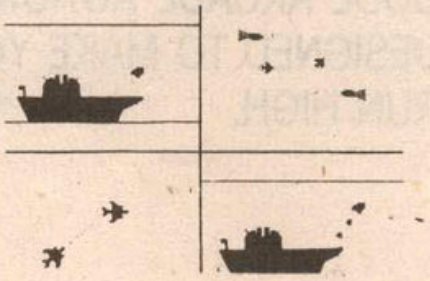
Skim as close as you dare to the surface of the planet, devastating the Martian cities, destroying ammunition dumps (gaining more time), shooting down the ground-to-air missiles and UFOs, dodging or blasting the meteorites.

"A real action shot of the game"

AIR-SEA ATTACK

For expanded Vic20
You can use 3K or 16K RAM

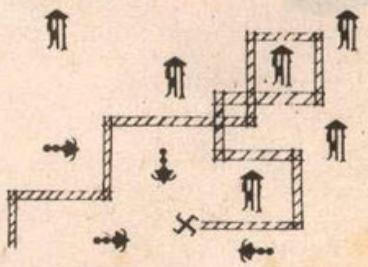
Can you plot a modern jet fighter? Take off from your aircraft carrier and engage enemy aircraft in battle, Shoot them down and then drop your bombs on the enemy aircraft carrier. Watch out — the enemy fighter is trying to do the same! If he gets past your air defence you are left to defend your own carrier with sea-air missiles. You each have three jets.



SHARK ATTACK

For unexpanded Vic20

You are in shark-infested waters after being thrown overboard from a pirate ship. Your only protection being an atomic net which you trail behind you, trying to cover all the visible ocean and ensnare the sharks at the same time. Beware of stopping or covering your tracks for too long, if you do, then the sharks will escape and come after you. Watch out for the ever increasing deadly octopi (somtimes the sharks will eat part or all of one!)



"A real action shot of the game"

MIND TWISTERS

For unexpanded Vic20
Four games to stretch your brain

Blackjack, Decipher, Four Thought and Teaser are our computerised versions of very popular home games and will test your mental agility and skill for many a long hour.

BLACKJACK

You start with £1,000, the objective being to break the bank, to do this you have to win (including your starting money) £20,000.

Instructions. You have to score nearer (but not over) 21, than the computer does. The computer deals your first card, you then place your bet and hit the return key, the computer then deals your second card. If you want another card hit the "C" key, if not hit the "S" key.

Points. Ace 1 or 11. Jack, Queen, King 10.

Scoring 21 points with 2 cards — you automatically win.

Scoring 21 points or less with 5 cards — you automatically win.

Draw — the computer wins.

Your kitty is automatically adjusted win or lose. If you lose all your kitty — game over.

DECIPHER

You have to guess what combination of colours the computer has selected — to enter a colour just hit the colour button on the computer, when you have entered your five choices of colour, the computer will display (a) Nothing at all — none right; (b) Black or white squares or both — for every black square you will have a correct colour in the correction position, for every white square you will have a correct colour in the wrong position. If you cannot find the complete combination, it will be displayed when you have had twelve attempts.

FOUR THOUGHT

You have to make a line of four squares — horizontally, vertically or diagonally BEFORE the computer does, taking turns to take a square (squares can only be placed at the bottom of the grid or on top of another square). **Keys.** Hit the number key of the column you want your square dropped in, then hit the return key.

TEASER

The aim of the game is to score "15" BEFORE the computer does, using any combination of three boxes. If you cannot score "15" then you must try and stop the computer from doing so and force a draw. **Keys.** Hit the number key of the box that you want (you can only select an empty box).

MULTISOUND SYNTHESIZER

For the unexpanded Vic20

The Vic Multisound Synthesiser is very flexible and can be played in more ways than can ever be explained here, to create music and special effects. For example, create any tune, up to 255 notes (after following appropriate instructions), then press "F1" or "F3", then key "9" and enjoy the added effect. Now hit "+", listen to the difference. For a surprise — hit "−". Now add a melody over the top — hit key "8" then "7" — now play a melody, or experiment. *Have fun!*

For the unexpanded Vic20

SEA INVASION

Fight off the attacking sea creatures for as long as you can. Shoot the whale for a surprise score, watch our for the crabs, starfish and octopi.

You are a commander of a fleet of destroyers. Looking on from the safety of Mother Ship, you send in one destroyer at a time to blast a passage through the

MOONS OF JUPITER.

Your destroyers have to dodge and blast the UFOs . . . Watch out for the Gologs, they can smash your destroyers, but you cannot harm them.

MACHINE CODE
ARCADE QUALITY GAME

SPACE ATTACK is a game of skill. You as the pilot of an intergalactic battleship have to fight your way through wave after wave of various alien spaceships.
