News Desk

Melbourne announces HURG

MELBOURNE House is announcing its *Hi-resolution User-friendly Real-time Games-designer* (HURG) program at the *Personal Computer World* show this week.

The package, which costs £14.95 and was written by William Tang, performs a similar function to Software Studio's *Games Designer* (PCW 15-21 September). HURG enables games, using a selection of pre-determined programming routines.

The program, which will contain three ready-to-play games, will be available on the 48K Spectrum in the middle of October. Versions for other machines, including the

Virgin has a change of heart

VIRGIN Games is to change its approach to the software market.

According to managing director, Nick Alexander, Virgin is in the final stages of setting up an in-house software production facility — similar to the sort of development team used by Psion, Ultimate and Melbourne House.

At the centre of the new

team will be a multi-user mini-computer, running advanced program development software capable of emulating the workings of different processors.

To begin with, three in-house programmers will be appointed — graduates drawn from the computer courses of the country's top universities. This number should rise to five by Christmas with the first programs from the team arriving in the shops in early 1984.

Says Nick: "It is obviously a colossal investment but it seems that is the way software development is going.

"It is a pity, because it means that the days when it will be possible for a single gifted amateur to develop a top selling game are numbered."

Since Virgin Games was launched in June the company has built up a range of titles all drawn from enthusiasts who replied to advertisements re-

How to submit articles

Articles which are submitted for publication should not be more than 3,000 words long. The articles, and any accompanying programs, should be original. It is breaking the law of copyright to copy programs out of other magazines and submit them here — so please do not be tempted.

All submissions should be typed and a double space should be left between each line. Please leave wide margins.

Programs should, whenever possible, be computer printed.

We cannot guarantee to return every submitted article or program, so please keep a copy. If you want to have your own program returned you must include a stamped, addressed envelope.

Accuracy

Popular Computing Weekly cannot accept any responsibility for any errors in programs we publish, although we will always try our best to make sure programs work.

Editorial

The computer market is looking, if not shaky, at least uncertain at the moment. Following the recent troubles at NewBrain, Dragon and Texas Instruments, comes news of difficulties for Osborne and Apple.

However, four home computer manufacturers are planning to expand their activities into the personal business computer area. Acorn, Dragon, Oric and Sinclair are all working on business micros for launch at the end of this year or in the first half of 1984.

Personal business computers is an area that has been largely ignored up to now. Micros have tended to fall into one of two categories — home (ie, cheap and 'non serious') or business (ie, expensive and 'serious'). Despite the efforts of firms like Computers, there has been little crossover between the two sectors of the market.

But, the new IBM Peanut would appear to be aimed straight between these two traditional 'breeds' of micro. Details of the Peanut are scarce, but it seems to be capable of fulfilling a dual/home business role.

Whether Acorn, Dragon, Oric and Sinclair will be successful with their new machines remains to be seen. But, the fact that IBM appears to be following similar lines must be encouraging.

The Six-Four Supplies Company is THE specialist for the Commodore 64. Our range of products in support of this machine includes a wide range of peripherals, devices and software to cover the needs of home and business user alike. We intend to offer an unrivalled selection of products, covering every aspect of using a Commodore 64.

SOFTWARE

The software list shows, in order: the product name/producer/product type/price prefix to indicate cartridge (r) disk (d) and cassette (c). These are fully itemised in our product sheets. Producers initials here simply identify like-named products for price checking. The product types are: acct:accounts; adv:adventure; ass(3)(u): three-pass assembler (+utilities); bus:business; comp:compiler; data:datafile; base; dbu:database(code)writer; edu:educational fn:financial; hfin:home finance; intf: interface lang:language/OS; madv:mystery; adventure; mon(a)(u):monitor(+assembler) (+utilities); rfd:reference datafile; sadv:space adventure; sprd:spreadsheet; stat:statistics; txd:texteditor; util:utility wp:wordprocessing; wpu:wordprocessing utility or link program. Indicated products are suitable for "serious" applications. Some prices may now be lower — credit given. Prices include p&p.

Virgin software

Continued from page 1

questing programs. This approach has met with mixed success — the company has gained a name for BBC software while Nick admits some of the Spectrum titles have not sold well.

Nick Alexander

Virgin plans more releases from its roster of freelance programmers in the coming months. October will see two Commodore 64 titles — *Falcon Patrol* and *Bitmania*; four Spectrum 48K programs — *Quetzalcoatl*, *Robber*, *Lost* and *Spectrum*; four for the BBC — *Microbe*, *Chieftain*, *Owzat* and *Trench*, and two for the TI99/4A — *Robopods* and *Fun-Pac*. This will be followed in November by four more for the Spectrum, three more for the BBC and one for the Dragon.

Virgin has also dropped its prices. As from its September releases Spectrum and Vic prices come down to £5.95, and Dragon and Oric tapes come down to £6.95. BBC titles stay at £7.95.

HURG

Continued from page 1

Commodore 64 and BBC B, will follow shortly.

Games written with *HURG* will be eligible for a £3,000 competition. Each month, until January 1984, prizes will be awarded to the three best games written with the aid of *HURG*. The overall winner will then be awarded the £3,000 grand prize. Details of the competition will be included with each copy of the program.

Made in UK

AS predicted (PCW, September 1) Acorn has announced a deal with AB Electronics to manufacture 100,000 Electron machines in the UK.

Commodore try to halt trend

HAVING been partly responsible for the recent micro price war, Commodore is now apparently trying to halt the trend, by encouraging dealers to keep prices up.

One retailer upset by Commodore's actions is Mike Mehdi of Crestmatt, who has reported Commodore to the Office of Fair Trading.

Crestmatt is currently selling the Commodore 64 machine £4 under a suggested minimum price of £199.95. He alleges that Commodore has threatened to cut off his supply of machines if he doesn't raise his prices.

Hitch for Aquarius

MATTEL Inc's announcement of huge financial losses has cast doubt over the future of the Aquarius computer, recently launched in this country.

The company recently announced financial losses of \$156.1m for the quarter to July 30. The blame for the fall was put on the company's electronic division — experiencing a slump in American video game and computer sales — which lost \$166.7m for the quarter.

Mattel reacted by announcing "sharply" reduced marketing of its Aquarius home computer in the US. This means that the Aquarius will not now achieve full national distribution in the States.

This in turn has cast doubts over the computer's future in the UK. Mattel UK's managing director Mike Lunch was anxious to dispel any fears for the Aquarius in the UK: "I think the worry is misplaced," he said.

He explained that Mattel has sold marketing rights for the Aquarius in non-English-speaking countries to the machine's Far Eastern manufacturers, Radofin.

Quicksilver's Christmas list

QUICKSILVER has announced its new titles for Christmas.

Four for the Spectrum: *Soft Solid 3D Ant Attack* (48K) and *The Flea*, *Gridrunner* and *Traxx* (the latter two by Jeff Minter in conjunction with

He also claims that Commodore will only grant him a dealership if he discloses the name of the company supplying him with machines.

Mike says: "The only way we can compete with the high-street stores is on price, by cutting our own profit margins."

Commodore, on the other hand, denies that any attempts are being made to impose a £199.95 price for the Com-

modore 64 model.

A spokesman commented: "We have no quarrel with Crestmatt — it is the person he is buying from we are concerned about. It is conditional on our supplying people that they adhere to our terms of business."

Mike Mehdi is determined not to disclose the source of his Commodore 64 supply. "I have now dropped the price of the Commodore 64 to £184.95 and will be holding it at that level up to the new year."

Lynx triplets

CAMPUS' 96K Lynx computer is now available, priced at £299. The new machine offers 37.5K of user-Ram in Basic and high-resolution colour. This compares with the 48K Lynx's 13.7K. The 96K also features additional Rom commands contained in a 4K extension Eprom. These include printer, joystick and light-pen commands, as well as *Circle*, *Triangle* and *Rectangle Fill* graphics commands.

Owners of 48K machines will be able to up-grade to the 96K for £89.95.

Next week's *Personal Computer World Show* will see the launch of the Lynx disc drive system. A single 5¼in single-sided double-density 40-track Alps unit plus Lynx operating system will cost £343.85.

Computers also hopes to preview its 128K machine with Lynx facilities disc and CP/M at the show.

Apple down

SHARES of Apple Computers fell by 25 percent on the New York stock exchange on Friday, September 23, after the company announced that fourth quarter profits would be "sharply" down.

Autumn releases from Thorn

COMPUTER WAR heads up Thorn EMI's autumn software releases — based on the hit movie *War Games*.

The title will be out on cartridge in October for the Vic20 (£19.95), Atari and Texas machines (both £29.95).

Other cartridge releases next month include *Mine Madness* for the Vic20 (£19.95) and *Carnival Masacre* for the Atari (£24.95).

In November, Thorn EMI will produce its first games on cassette for the Spectrum. No prices are available yet but the titles are: *Volcanic Planet*, *Gold Rush* and *Blockade Runner* for the 16K model and a version of *River Rescue* for the 48K.

At the Barbican

POPULAR Computing Weekly will be on stand number 444 at this week's Personal Computer World Show at the Barbican, London.

LOOK FOR THE 'ULTIMATE' NAME FOR THE 'ULTIMATE' GAMES

JET PAC for the 16/48K Spectrum.
JET PAC - The Ultimate Space game.
 Arcade standard, 100% machine code, incredible sound effects, amazing smooth high resolution colour visual graphics, the totally new concept and all those extra features you expect from the ULTIMATE GAME people. Design: The 'ULTIMATE PLAY THE GAME' Design Team.

'JET PAC'

PSSST for the 16/48K Spectrum.
PSSST - Go grow yourself a real game.
 Amazing smooth high resolution, 100% machine code, incredible sound effects, amazing smooth high resolution colour visual graphics, the totally new concept and all those extra features you expect from the ULTIMATE GAME people. Design: The 'ULTIMATE PLAY THE GAME' Design Team.

'COOKIE'

COOKIE for the 16/48K Spectrum.
COOKIE - Charlie, chef and the Ingredients vs Bin Monster and the Nasties.
 Arcade standard, 100% machine code, incredible sound effects, amazing smooth high resolution colour visual graphics, the totally new concept and all those extra features you expect from the ULTIMATE GAME people. Design: The 'ULTIMATE PLAY THE GAME' Design Team.

'PSSST'

'TRANZAM'

TRANZAM for the 16/48K Spectrum.
TRANZAM - The high speed real time rough driving pursuit race across America.
 Arcade standard, 100% machine code, incredible sound effects, amazing smooth high resolution colour visual graphics, the totally new concept and all those extra features you expect from the ULTIMATE GAME people. Design: The 'ULTIMATE PLAY THE GAME' Design Team.

These games should be available from **W. H. SMITH, JOHN MENZIES, BOOTS, LASKYS, SPECTRUM CENTRES, OTHER LARGE DEPARTMENT STORES and ALL GOOD MAJOR SOFTWARE RETAILERS**, alternatively send the coupon to **ULTIMATE PLAY THE GAME** for immediate despatch. Subject to availability your order is normally despatched by return.

£5.50 each
 including VAT, first class postage and packing in UK.

ULTIMATE PLAY THE GAME is a trade name of Ashby Computers & Graphics Ltd. The Green Ashby de la Zouch Leics. LE66 5JL

Dealership enquiries welcome, phone (0530) 411485.

Post this coupon now, to **ULTIMATE PLAY THE GAME, The Green, Ashby de la Zouch, Leicestershire LE66 5JL.**

World champion?

OK you guys. So you think you're good! I challenge you to beat my friend David Willmer's score of 169,990 on Interceptor Micro's *Frogger*. Beat that if you can — it took David 40 minutes using my Commodore 64. Is David the World Champion?

Adventure helpline

In response to Stephen Ren-ton's letter (Vol 2 No 36), I heartily endorse his suggestion for a machine code helpline, and/or a machine code pen pal section, but cannot agree with his views on the adventure corner helpline, though a bit more solid 'info' and a little less 'in' comments or asides would be appreciated.

I'd also like to back up Mark Fussell and others in requesting a return to a m/c series for the 48K Spectrum and agree with his reasons for buying your magazine.

The problem with all the m/code articles — and books which I have read — is that there always seems to be a vast gap between a very 'beginners please' type: "don't forget to press enter" — and the heady heights (to me) of vast strings of numbers without practical information on how to use them.

R B Mote
1 Barmouth Avenue

Captain Red Ken

Skipping all the 'your magazine is great, please print my letter' trash, I will get straight to the point.

I have decided to go into the software business. As I don't consider myself a second Jeff Minter, I am in need of help.

I would be very grateful if Vic20 owners with programs they consider to be commercially viable would send them to me. This will be an under 16s outfit, with 50 percent

royalties. It doesn't matter if your programs aren't in the *Astron Belt* class, there are such things as gamestapes.

I would also like to know your advertisement rates as, if I ever get this off the ground, yours is a magazine in which I would like to advertise.

Finally, Rabbit Software's *Myriad* holds no further mysteries — I have scored 1,125,000 plus, going round two times and finishing with 30 lives and something in the region of 100 shields. This, I must point out, was achieved on a tape supplied free of charge by Rabbit when I told them mine was faulty.

Captain Red Ken
42 Freshfield Road
Formby L37 3HW

PS. If anyone submitting tapes wants them back, please include a SAE.

Well, Captain Red Ken, I don't know how many of our readers will want to take up your offer, but it seems only fair to give them an opportunity to do so. Our advertising department will be happy to send you a copy of our rates.

Wrongly numbered

Regarding the extremely useful article and program on word processor for Spectrum 48K (*PCW* 15-21 September, page 20), the hex-loader (incorrectly numbered program 2) will not run as listed. I suggest the following lines will do the trick:

```
31 IF LEN X $/2<>INT(LEN X $/2)
   THEN PRINT "INCORRECT EN-
   TRY": GOTO 30
45 LET XS = XS (3 TO)
```

D Warner
29 Heath Farm Road
Ferndown
Dorset

Apologies to anyone who tried to enter Dale McLoughlin's word processing listing and failed. Programs one and two were numbered the wrong way round.

Sinclair user group

We have noticed recently, in several of the computer magazines, letters claiming that there is a shortage of user groups for Sinclair users. Apparently these users are not aware of our own group which

has members around the world.

The International Sinclair User Group (ISUG) was formed as a result of the demise of the former, well-respected, National ZX User Group, organised by Tim Hartnell.

We would be grateful for a plug on your letters page and club file to dispel this nasty rumour that Sinclair users are without representation. All that is needed is a letter to us at the above address, a stamp for the reply would be appreciated (not an SAE), this will

Conditional statement

I found J Coote's *Turtle* interpreter for the ZX Spectrum in a back issue of *PCW* (Vol 2 No 30). I have implemented it and had a lot of fun with it.

The author asked for suggested additions. One that I have made is a conditional statement.

The most natural syntax for such a statement would be "if cond do S1 else S2 then ...", meaning that the numerical expression *cond* is evaluated, the program executes *S1* or *S2*, depending on the value of *cond*, with program execution continuing after *then*. However, it simplifies the programming to use the form "if cond (S1) (S2) ...", since there is already a subroutine to locate bracketed substrings for the "rep" command. The relevant additions are:

```
320 IF TS = "if" THEN GOTO 1500
1500 GOSUB 40: GOSUB 45: LET
   cond = VAL Z$ (1 + 1 TO f - 1):
   LET PS = Z$ (f + 1 TO e - 1):
   LET Z$ = "X" + Z$ (e + 1 TO)
1510 GOSUB 45: LET QS = Z$ (f + 1
   TO e - 1): LET Z$ = "X" + Z$
```

bring full details plus an application form.

We welcome applications from both seasoned veterans and newcomers alike, so let's hear no more nasty talk about non-representation.

Peter Paton and Vic Webber
ISUG

176 Todmorden Road
Burnley
Lancs

It's good to see someone attempting to fill the gap left by the closure of the National ZX User Group. ISUG has our best wishes for the future.

```
(e + 1 TO)
1520 IF cond THEN LET Z$ = "X" +
   PS + Z$ (Z TO): GOTO 100
1530 LET Z$ = "X" + QS + Z$ (Z
   TO): GOTO 100
```

The *Turtle* accepts recursive calls to object definitions — with "if" we can ensure that the recursion "bottoms out" and thus draw famous recursive pictures like the snowflake and dragon curves.

Of course, recursion raises the vexed question of local variables. In this case, the only *Turtle* variable is "siz". For most purposes, it is sufficient to ensure that, whenever a definition is called recursively, the value of "siz" on leaving is returned to its value on entering. Thus, the following lines define the snowflake curve:

```
obj side if siz<3 (dra siz) (siz siz/3 side
   tur 60 side tur-120 side tur 60
   side siz siz * 3)
obj snowflake rep 3 (side tur-120)
```

Now a business spreadsheet for home computers

Clear and easy to use

2000 cells
(600 in 16K VIC 20)

Global column width adjustment

Variable individual column width

Insertion or deletion of rows and columns

Save, load and merge capabilities.

22 mathematical and statistical functions

Formatting by cell or whole sheet

Fast alpha-numeric search

Comprehensive instruction manual

Replication across columns and rows

Horizontal and vertical titles can be fixed

Graphics facility to display your results

Powerful alpha-numeric sort, highest to lowest and lowest to highest

With Practicalc you can use your 16K VIC 20 or Commodore 64 to carry out sales forecasts, modelling, cash flow projections and much more.

Compare the professional features and power of Practicalc Plus or Practicalc 64 with other spreadsheets.

Compare the price. You won't need a

spreadsheet to calculate the best buy.

Centipede

A new game for 48K Spectrum by Jim Provan

This is a version of the arcade game *Centipede*. The object is to shoot all the bugs which attack you.

The different creatures and their characteristics are listed below.

1. The Centipede: This is the long, snake-like creature which runs across the screen. 500 points are awarded if you hit the body, 1,500 if you hit the head.

2. The Spider: the spider is the yellow creature which bounces around the lower

half of the screen. It is worth 300, 600 and 900 points depending how high up it is when hit.

3. The Flea: The flea is the green bug which drops straight down the screen. When hit it does not stop, but keeps on coming until it reaches the bottom. It is worth 500 points each time it is hit.

4. The Wasp: The wasp is a red creature which 'homes in' on your base. It is worth 1,000 points when hit.

Also present are mushrooms. These appear at random, either half or whole. The bottom scores 50, the top scores 100. BEWARE: on hitting the top of a mushroom, it is turned into a rock. If this is hit, you lose 1,000 points.

An extra base is awarded every 20,000 points. You initially begin with three. A\$ in line 9500 should be typed in as "I@%&'— ↑ £1 []" (or any twelve symbols you do not need).

AGF

PROGRAMMABLE JOYSTICK INTERFACE

for Spectrum or ZX81

ONLY
32.95
+£1.00pp

MICRODRIVE
COMPATIBLE

ABOUT OUR INTERFACE

The AGF Programmable Joystick Interface is a unique design offering the use of any Atari-compatible joystick with absolutely all software, whether it is cassette or ROM cartridge, with the Sinclair Spectrum or ZX81.

The hardware programmable interface requires no additional software and accurately replicates the keys of the computer in a manner which is responsive to absolutely ALL key reading methods, both BASIC and Machine Code.

The interface does not interfere with key operation and can therefore be used simultaneously with the keyboard.

There is no need to remove the interface once fitted as the rear extension connector will accommodate further expansion, i.e. printers or RAM packs etc. This important feature avoids excessive wear to the expansion port.

The key replication principle pioneered by AGF means that your own programs can use eight directional joystick movement by utilising simple key reading BASIC.

Two joystick sockets are provided which share the same keys, for use with the majority of two player games. Several interfaces may be used on the same computer for multiple joystick applications.

The interface is programmed by a two digit code, which is looked up on a programming chart supplied, for each direction and firing button. The two numbers are then selected on a pair of leads which are clipped onto appropriately numbered strips on the interface.

Once configured this can be marked on a Quick Reference Programming Card for storing with the game. As the programming is *not* power dependent the interface retains the last configuration made and can be immediately used when next switched on.

KEY FEATURES

- ★ Programmable design gives TOTAL software support.
- ★ Accepts Atari, Competition Pro, Wico, Starfighter, Quick Shot, Le Stick etc.
- ★ Rear extension connector for all other add-ons.
- ★ Free demo program and instructions.

PACKAGE CONTENTS SUPPLIED

- Programmable Interface Module as illustrated, complete with clip-on programming leads.
- Self adhesive programming chart detailing how to define which key is simulated by UP, DOWN, LEFT, RIGHT, and FIRE. This can be fixed on to the case of your computer or if preferred the protective backing can be left on. The chart is made of a very durable reverse printed plastic and is extremely easy to read.
- One pack of ten Quick Reference Programming Cards for at-a-glance setting to your games requirements. The card allows you to mark the configuration in an easy to read fashion with space to record the software title and company name.
- Video Graffiti demonstration program which is written totally in BASIC to illustrate how all eight directions and fire can be read. This is also a useful high resolution drawing program.
- 12 months guarantee and full written instructions.

Roger — ground control

David Kelly talks to Roger Peel about the UOSAT project

It is now beginning to look as though Britain won't get its first satellite tv networks running by 1985 as originally hoped.

No standards for direct broadcast television have yet been adopted, mainly due to internal wrangling within the various European countries. Consequently, no one is particularly keen, apart from the French, on going it alone.

In the United States, the situation is a little different. Rupert Murdoch plans to start his New America satellite channel for 1984 while Home Box Office — a film channel — has already proved a runaway success.

Satellites, everyone is convinced, are going to become very important. Not just for broadcasting tv, but also for interactive communication, telebanking, armchair selling and all the other things that home computers will make possible.

Putting up a satellite is an expensive business. To get a complex direct broadcast satellite up there is going to set you back at least £20m.

Although communication with the bigger satellites will be strictly controlled, it is possible for any interested person to get in touch with one of the amateur satellites.

Amateur satellites, of which there have been 16 so far, send out signals which can be picked up by any radio amateur.

One such orbiting radio beacon is UOSAT. This satellite — standing about three feet tall — was launched as a secondary payload on a Nasa Delta launcher in October 1981. It cost Surrey University a mere £120,000 — as an educational craft it was launched free of charge.

Roger Peel is one of the ground support team for UOSAT. He explains: "The time from beginning work on the project to its launch was only 2½ years — very tight in space terms."

The core of UOSAT is a computer, of course. But not quite the megabyte marvel one imagines a satellite ought to possess. UOSAT contains only two small processors, an RCA 1802 and a Ferranti F100L, and 16K of memory.

The main use of the computer is for data storage. Information on, say, the strength of the earth's magnetic field, is collected by the computer and then broadcast in fairly concentrated bursts.

The data is comparatively simple to decode — being an amateur radio satellite. In fact, it is the first satellite ever to contain a simple speech synthesiser. Data transmitted on some weekends is sent as 'spoken' data.

"We only 'see' the craft for 15 minutes six times a day — when I say see, I mean see its radio transmissions. I don't know of anyone who has actually seen it. It's very small.

"The computer can store information from one orbit and transmit it in sections for the next 10 hours — giving us information about the field strength and radiation count."

Roger is responsible for writing almost all of the computer's software. To save space — 16K is not much — programs are written in assembler code. For every new program up-loaded to the craft for a new experiment, a whole suite of programs has to be written for the ground-station to handle the data transmitted back.

"Each program has to be very thoroughly tested to be as bug-free as we can make it," says Roger. The university uses a duplicate of the spacecraft's computer on the ground to test programs before they are up-loaded.

"For writing programs, 16K has not proved to be that much of a problem — 16K of assembler program takes quite a lot of writing.

"But for data storage, 16K is quite a serious restriction. Obviously, we do as much as we can to store things as economically as possible, but there is a limit to how far you can compress the information — for experimental data there is a lot less opportunity for compression than in English text, for example."

UOSAT is fairly densely packed compared

with a commercial craft. It also has none of the elaborate stabilisation mechanisms — spinning gyros and gas jets — needed to keep a broadcast satellite pointing always at the same point on the globe.

"It is an amateur satellite — not in the same league as the Voyager series, for example, which are orders of magnitude bigger. UOSAT weighs about 60kg. Many large communications satellites could

weigh about the same as a car."

UOSAT is only a broadcast satellite. It does not 'transpond'. In space jargon, there are no publicly available up-lines. Only UOSAT control can send information and new software programs up to load into the on-board computer.

UOSAT transmits on 145.825 MHz and the signals can be picked up by an ordinary narrow-band fm hand-held receiver with a whip antenna — typically costing around £50.

"Listen on that frequency and you will hear the tones (called telemetry) — often at the weekends we use the on-board Digitalker to speak the data."

The ordinary telemetry signal can be decoded quite simply. A very crude device can be made for about £7 from about three integrated circuits. A design for one such circuit appeared in the May 1983 issue of *Wireless World*.

Basic information on orbital patterns is given on an answerphone service on Guildford 61202 and an accompanying computer program was printed in *Popular Computing Weekly*, April 21. A news sheet, giving more details of how to get data down from UOSAT and analyse it, is available — if you send a stamped addressed envelope — from the Department of Electronic and Electrical Engineering, University of Surrey, Guildford.

The data sent back from the satellite — the basic telemetry frame — contains 45 status numbers which show what equipment is turned on or off. There are also 60 analogue channels which give information on temperature, rotation, radiation count and magnetic field strength.

All of this information can be collected by any amateur with an appropriate receiver and decoder.

It is possible to see how the radiation count varies over the earth's poles or how the battery voltage is affected by sunlight on the craft's solar panels.

Anyone wanting to experiment by taking data off the spacecraft should think about doing it reasonably soon, though. Says Roger: "All orbits decay — the craft gets pulled down towards the earth — and, one can never be certain, but, we reckon that UOSAT has only an orbital lifetime of about another three years.

"Then the craft will re-enter and burn up in the earth's atmosphere."

Games unlimited

Mike Grace attacks the mutant camels in a round-up of games software for the Commodore 64

If you went to the Commodore Show in June you must have seen a revolution in graphics for games of the future, and if the press releases are to be believed (which most of us find trouble in doing!) then it'll be in the not-too-distant future as well. I'm talking about a football game which has out-of-this-world graphics — green field, terrific depiction of the players, crowds, etc. The game looks just like a cartoon — not a typical high-resolution picture. But if you think that's good — then another demonstration on the Audiogenic Stand of a game called *Alice in Wonderland* puts even Commodore's efforts in the shade when it comes to graphics.

The fact that many of the Vic20 games are now coming out on the 64 (and vice versa) convinced me that I ought to concentrate more on the 64 this time around. But don't worry, Vic owners — I still have my faithful Vic to keep bashing away at the new releases.

Let's start with a couple of games from a company new to me, Postern Limited, who call their range of software Imagination Unlimited. The two games are called *Snake-Pit* and *Shadowfax* and are available on cassette (at £7.99) and — hooray, hooray — on disk (at £9.99). I had the cassettes to review, and they were packaged in a largish box (as in *Rabbit* and some Commodore cassettes) — but unlike others I've seen at least Postern retained the cassette box for you to keep the tape in (in a cassette rack if you own one). The artwork for both games was a little amateurish, but the instruction sheet on the reverse of the covers is excellent.

I loaded *Snake-Pit* first into the 64. After a short loading time the screen filled with little green dots (eggs!) and small neatly placed rectangles containing writhing snakes which were trapped inside their little rectangle. On closer examination one of the little eggs was seen to be a grinning face with a mouth that kept opening and closing reminiscent of a goldfish (the gobbler!). The idea of the game is for the gobbler to eat all the eggs up (Pacman-style) before a snake eats *him* up. As the eggs surrounding one of the trapped snakes are removed so it can escape, chase and eat up the gobbler.

Obviously the more eggs the gobbler eats the higher the chance of being eaten himself — and just to keep him alert there is a nasty red snake who is also going around eating all the eggs, thereby releasing the other snakes as well. If you do survive to eat all the eggs then you enter phase 2, where the gobbler can now eat up the snakes (tail first, I might add).

So how did I rate it? Well, the first problem was the gobbler was rather slow

(as the game is machine code I assume this is intentional), but I wanted him to get on and eat up the eggs faster. Secondly, it is quite a hard game as the snakes are soon writhing around all over the place, so a little trick I tried was not to move the gobbler straight away, but allow the red snake to eat up a lot of eggs first.

The game was quite nicely presented, the graphics were adequate (I've been spoilt by *Alice in Wonderland*) and it wasn't too hard to play. A sort of blend of *Pacman* and *Serpentine*, I suppose. It struck me as being of good value at £7.99.

Judging by the success of *The Hobbit* for the Spectrum, I should think more computer enthusiasts at least know about Tolkien's *Lord of the Rings*, even if they haven't read it. Well, *Shadowfax* is taken from the book, and is the sequence where Gandalf (alone in the computer game) is riding his horse Shadowfax against the Black Riders of Sauron, armed with only his wits and a handy supply of thunderbolts. At last I saw a beginning to some of the extra capabilities of the 64, for in this game the borders of the screen have trees lining the path which it is possible to ride behind (here we witness the sprite capabilities of the 64 in action) and the graphics really capture some of the feeling of both the book.

Gandalf (all in white) gallops his horse from right to left whilst a horde of Black Riders gallop towards him. One touch of any part of an enemy horse or rider will kill Gandalf (no extra lives in this game) so he must either dodge the enemy by moving the joystick up or down (no sideways movement is necessary as the background moves along at quite a pace simulating the horses movement) or des-

troy the rider with a thunderbolt.

The game is good, compulsive and quite difficult. If you do manage to keep alive, you then meet the purple-coloured Sauron (I assume) and that's a whole new ball-game, but I won't spoil it for those dedicated enough to get there. The graphics are the best I've seen in the games I've reviewed for the 64 (and the Vic), and a soundtrack of galloping hooves (extremely effective) plus quite good zapping thunderbolts makes this my favourite game of the bunch. I'd say £7.99 is a good price for value. A final word of warning about this game — watch out when the thunderbolt makes a zooming noise!

Not so long ago there seemed to be only one game available for the 64 — a game with the most convoluted title. I'm talking, of course, about *Attack of the Mutant Camels* from Llamasoft. On cassette this game comes with fairly average packaging and is described as a 'hyperfast blast for Commodore 64' (not my words, I assure you) and gives you 31 levels of skill! I find it pretty difficult playing most games on Level 1 — the thought of 31 levels is pretty 'awesome' (to use another Llamasoft phrase), but it's sensible and satisfying to see programmers building playing-extension time into their games.

There is the usual loading time (the screen blacks out, then the logo AMC (Attack of Mutant Camels) appears, plus a series of options which you can control with the Function keys. Possibilities include one or two players, where you wish to start, and whether you want to have a collision option.

On to the game itself. It seems some aliens have taken off our camels and mutated them into 90-foot walking laser-spitting death beasts, so we have to pilot our little spacer and kill them off (Luke Skywalker style as in *Empire Strikes Back* against the Walkers). It's a sort of *Skramble* with camels to attack instead of enemy fighters, and to make it harder the camels aren't killed in one blow, but need several shots (during which they change colour with added realism). Along the top of the screen is a score plus a section telling you how many camels you have to beat and where you are in relation to them.

The game is noisy and fast (as are many of Jeff Minter's games) and although the camel graphics lack a little in sophistication they are good enough. As most of the time you are dodging the laser bolts that the camels 'spit' at you, there isn't really time to appreciate the finer points of the graphics anyway. It's another difficult game and even on the simplest level lots of skill is needed to weaken the camels enough to destroy them before you're blown to smithereens. At £8.50 it is good value and should keep dedicated gamers going for quite a long time.

Star Trek is an old favourite with games players, or at least with games software houses. In case anyone is still out there who doesn't know how to play it — a brief

resume. You are in control of the Starship Enterprise (going boldly where no man has gone before) and looking for the Klingons in space. You have various screens to help you (a Galactic Map which tells you where you are in space), a Sector Map (which tells you what is in your sector of space) and the ability to warp into another Sector and do battle with the Klingons. During the battle you may be damaged and so find your ship unable to fire torpedo bolts or phasers, or even to warp away to safety. Usually you also have Star Bases where you can refuel and restock. If you do not destroy all the Klingons — you're doomed!

I have always found this game enjoyable, so it was with a hope of increased facilities that I loaded Interceptor Software's version into the 64. Loading completed, a very impressive title section appeared with stars winking into existence and the words *Star* and *Trek* appearing from the top and bottom of the screen and scrolling towards each other. I was then given the choice (on a small and slightly off-balance menu) of instructions, or various modes of play. I chose instructions, and received about a dozen pages of complex and interesting instructions, none of which I could remember once the page had gone (but not to worry as I was told I could call back the instructions at any time).

I tried very hard to like this game — but I couldn't. There's no doubt that someone has worked extremely hard and long to produce an epic which does justice to the increased memory facility, but at the expense of the understanding of the player I suspect. It may have been an off-day, but I'm familiar with *Star Trek* and have played several versions on the Vic. This time I couldn't fathom how I was supposed to find the Klingons, or what was going on most of the time. It seemed as though the screen was filling with masses of information about planet types, energy supplies,

warp drives, etc. Each time I pressed a Function Key I got a screenfull of information, which I was supposed to remember — I couldn't. It seems a great shame, because surely the fascinating possibilities of the game on the 64 are greatly extended... but I think the programmer knew his own game too well and has just made it too complex.

For the *Star Trek* fanatic who is really into the intricacies of War Games this is possibly a winner — for you ordinary mortals I feel this is not the one. And if you do get into a really exciting game and find time running out there's no capability to save to tape or disk — a criminal omission. It felt as though it had been rushed out for the 64 too early, and at £7.00 is too expensive.

Interceptor have also produced a 64 version of *Krazy Kong*, also priced at £7.00. The main difference in this version is that there are multi-screen levels to work through. The graphics are poor, but I still found myself playing the game for rather a long time — so it must have been addictive. It's a particularly infuriating game, because besides the barrels and hammers, there are a number of randomly placed diamonds on the girders that your little man has to jump up and collect, otherwise when he gets to the girl at the top (who isn't pictured in the first screen) he won't get the prize. Unfortunately the jump key didn't always make him jump on my joystick — adding to the infuriation. But I began to get the hang of how much to jump and the distance as I got used to this version.

I think the main disappointment was the poor graphics. Kong is a poorly-outlined silhouette, the man is just a stick-like symbol, and the diamonds and hammers are very simple symbols. Although these graphics don't really spoil enjoyment of the game, with the increasing competition nowadays I suspect this will detract from the arcade copies unless there is a reduction in price.

Let's move to Anirog Software for the

final review. It's the 64 version of *Froggun*, and regular readers may remember that when I reviewed this game for the Vic I not only enthused strongly, but I can still say it's one of my favourites. Well, the 64 version is very much the same, except that a little musical tune is played when you get the frog home, and this time we have crocodiles in the river from level one (and a crocodile or two lurking in some of the homes as well to make it harder). But, for some inexplicable reason, I didn't like the graphics as much on the 64 version as I did on the Vic.

All the good points of the Vic version are present: the incredibly responsive joystick control, the fast-moving traffic, the lady frogs, the snakes on the river bank. . . . When compared with some versions of *Frogger* I've seen I'm still amazed that other versions sell at all. However, there is one point that I'd like to make at this stage — and that is the ease or difficulty of games in general. I know it's hard catering for the real enthusiast — but I do feel that games are becoming harder and harder and this is not necessarily a good thing. It is probably because the programmers are themselves real enthusiasts who not only spend almost every waking hour playing, but think many of us do as well.

It seems to me possible to have several skill levels which allows the casual player to win reasonably easily and then he can move up a notch, whilst the true gamer can move on to a higher level from the word go. Anyway, *Froggun* is £6.00 from Anirog Software and if you haven't a Vic then the 64 version is a good alternative.

So there we are, the 64 is getting a good share of Software at last. What I feel is that, apart from *Shadowfax* none of the games I reviewed this time are really using the full capabilities of the machine. Commodore's own games are being released, and they do show promise, but I cannot help but feel that some of the others are being rushed onto the market to fill a gap too quickly, and without proper thought for the customers or the extra facilities. ■

An alien intelligence

Peter Bartley adds a postscript to his series on gameswriting for the Vic20

Over the past six weeks I have introduced a few ideas, explained a few details and demonstrated a few tricks to beginners in Vic computing. The area we've concentrated on is what I call the "X-zaps-Y-zaps-X"-type arcade games.

As I've mentioned before, these games on the Vic are dependant on the fact that the screen memory locations in front of any moving graphic missile or spaceship can be peeked to see if they've hit anything, as well as providing fine opportunities to use graphic and sound effects. Although these are the easiest to simulate, they aren't, as the video freaks among you will know, the end of the story.

There are the Maze/Chase games: A certain Atari game springs to mind, as do variants such as *Rally-X*. Commodore's *Jelly Monsters* and *Rat Race* cartridges are typical conversions to the Vic, as was the ill-fated *Vicmen* on tape. Programming here is different. The problem is to give the meanies, be they ghosts, rats, or alien beings from an unknown planet, some kind of intelligence. Here again screen peeks are paramount in determining where exactly the ghosts are in the maze. The players screen position can also be used to give them some kind of direction rather than the aimless wanderings of a random-direction generator.

This brings us to the question of giving the computer some brains. Most people shy away from programming the Vic to play against the user as being too difficult. But when it comes down to it, whenever two humans play a game they're following a set of unconscious/unwritten rules. All you need to do to convert it to the Vic is to think very carefully about all the rules.

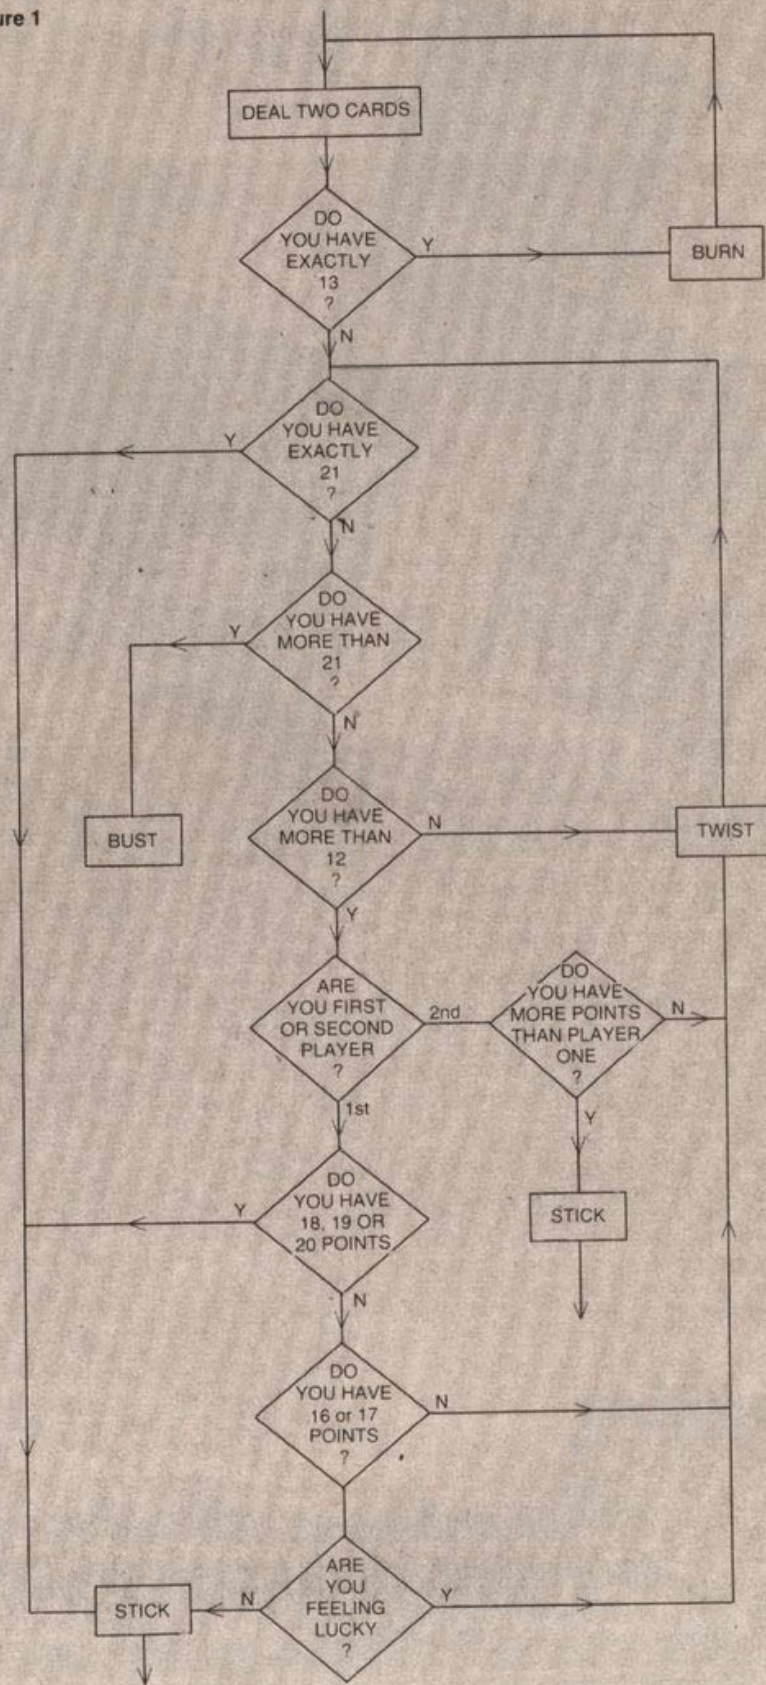

Pontoon is a prime example. Object: to get as many points above 12 and below 22 as possible. Even without making Vic the banker there's very little problem here (if it were the banker, it would then "know" when to stick or twist on every occasion). You'll find that most two player games (especially cards) can be "translated" into a set of rules suited to computer conversion.

After all, Othello, backgammon and even chess have been converted — though obviously you can't be expected to write a chess program immediately! However, don't be daunted by the prospect of giving your Vic "a bit o' sense".

If you haven't done this sort of thing before, the best thing to do is to choose a fairly simple card or dice game for two players and use what I call a "structured routine" as the backbone of the program. That is, have a series of "If... Then"s and

Continued on page 19

Figure 1

Dragon & Dungeon

6 exciting new programs
for the D32

£5.95

THE MIDAS MAZE

£7.95

MIDAS MAZE

All that glitters in the Midas Maze is not gold! With Magic Holes to fall in and a Devil's Kitchen full of Powver Pies to contend with, you may not find the direct route safest. You may even be teleported!

TREASURE TOMBE

Although the castle on Glastonbury Mound has crumbled, the vast dungeon complex below remains intact. Before his death, Merlin placed Arthur's treasure in the vaults and conjured up a coven of his donjon-spawn to stand guard. For all eternity they prowled the pitch-black chambers, dedicated to kill foolhardy intruders.

The year is 1086 and a party of Normans have unearthed the collapsed entrance vault. You squeeze through the jumble of shattered blocks and find yourself in a chamber where only the last glimmer of daylight penetrates.

Screw up your courage and prepare to explore...

£7.95

THE CRYSTAL CHALICE

£5.95

THE CRYSTAL CHALICE OF QUOROM

The Dark Forces of Klartz were held at bay from Quorom by the power of the Crystal Chalice, but when (finally) they broke through, the Chalice was shattered. Now its fragments are scattered to the four corners of the Kingdom, darkness reigns supreme and a thorn-spiked Tanglewood has overgrown the Meadowplain.

As an Apprentice Adventurer of the Second Order, you have been selected to quest for the lost shards of the Chalice and, through death and danger, to return them to the Palace. Then (and only then) will peace and light return to the stricken Kingdom.

MATHS-TREK

To bring the 'Enterprise' back to Starbase, through the Black Holes, Asteroids and Klingon Gunships, you'll have to prove that a Space Captain can handle his maths. Suitable for children aged 6-12, 'Maths-Trek' can be set for any one of six branches of mathematics with 50 different levels of difficulty. Too many wrong answers and you may run out of fuel! Too much damage and the 'Enterprise' may break up!

£7.95

TEMPLE OF ZOREN

£5.95

TEMPLE OF ZOREN

Terran Security classed it as a suicide mission - and then chose you! Now, after fighting your way through the Zoreen guardships, out of fuel and with a damaged computer, your survival prospects look even slimmer. With Guard Robots and Secret Police ringing the outworld capital, even penetrating the Ringwall will be bad enough. Only Agent 6809 would stand a chance, but, with the shipboard Reincarnation Unit on the blink, even YOUR survival looks questionable. So, grit your teeth, hit the retros and prepare for the mission that could end the Rimwars!

GIANT'S CASTLE

Somewhere within the castle a fair maiden has been imprisoned by the wicked giant. Are you brave enough to explore the halls and dungeons to rescue her?

To claim a hero's reward you'll have to prove yourself smarter than the creatures who guard her!

P.O. Box 4, Ashbourne, Derbyshire, DE6 1AQ.

PROGRAMMING

"On ... Goto/Sub"s gradually "filtering out" duff moves and finally deciding on an "action".

Flow-charting is very useful in this context — see Figure 1 for a sample of a "pontoon" routine. As you can see, all the questions can be replaced by BASIC equivalents ("If SC >= 18 Then Print "Stick On "SC", etc. Even the "Feeling lucky?" question can be simulated by the And function.

In other types of "thought" games it is often preferable to assign "priorities" to various positions or situations. In the case of board/strategy games, each opponent's piece (or position, depending on the game) would have a different "desirability" rating according to its relative strengths and weaknesses. (Just a simple numerical value; so that when the computer assimilates the data it knows to go for the highest priority move or capture).

For example, in certain commercial chess programs, "taking the queen" is the highest priority move, even at the loss of one's own queen. And again, if we were to write our own Othello program, we would assign highest move priority to the four corners (giving them 9, say), and lowest priority to the central squares (possibly 1 or 2), since as every Othello player knows, the four corners of the board

are by far the most important.

These are just a couple of ways of producing "artificial intelligence". They're useful programming practice and hopefully more mentally stimulating than blasting aliens, and have the added interest that as your programming improves, so can the Vic's playing ability.

Of course there are other types of games to work on if cards/dice don't take your fancy; such as *Surround* (an old Pet game recently resurrected in the light-cycle sequence of the film *Tron*) or *Battleships* (I've still to see a Vic *Battleships* that really plays and isn't just a vamped up guessing game using the random number generator ...). Then you can start inventing your own strategy games.

The thing about games of this sort is that they're so well-suited to BASIC. *Pokeing* 50 Space Invaders on and off the screen, as well as scanning for hits/misses and key presses is going to take a very long time — which doesn't make for a very exciting game. That doesn't mean that all arcade games are out: ones with just a few characters adapt well, especially "oldies" like *Dogfight*, for example.

Other games include adventures; but with only 3.5K there's very little room to produce a game with any real variation. The technique is to first define your

playing area — caverns, planets, etc, and more importantly, how they are connected. Scatter a few monsters about, and a few things to collect, and let someone else loose on it (after all, you'll know its ins and outs already!).

Going back to the point about memory: try and keep all your programs as streamlined as possible. Apart from obvious techniques such as keeping excess characters to a minimum, there's the not-so-obvious, like sound effects subroutines whose parameters are defined before *Gosubbing*. Even just a simple delay loop as a sub-routine saves a tremendous amount of memory in longer programs.

A final word about gameswriting: To be frank, Vic games in magazines have dropped dramatically in number recently. They haven't got any worse; in fact, the quality has markedly improved, but the problem seems to be a lack of topics. If you're stuck for something to write about, just look around you! Look at a few books for inspiration (but mind the copyright!) — there's everything from the entire animal, vegetable and mineral kingdoms to sports and simulations, machinery and monarchies, racing and reflexes ... the list is endless. Use your brains (if too much Vic computing hasn't caused them to atrophy): after all, who thought up all those arcade games in the first place?

Interrupted lesson

Guy Dobinson explains how to teach French in the classroom — by interrupting

The following interrupt routines were developed to be used in programs intended for the teaching of French in classrooms. The main programs had to be written in Basic for reasons of easy adaptation, but two serious problems could not be solved using this language.

Firstly, letters with accents had to be entered as user defined graphics, without constant fiddling with the graphics key. Secondly, the *Break* key had to be disabled. True, the *Break* key can be disabled by *Poking* the lower part of the screen down to zero lines, but then any attempt to *Break* causes a crash and the program has to be reloaded from scratch.

In both cases, interrupt routines provided the answer. Furthermore, interrupt routines are an ideal place for the inexperienced machine code programmer to start, as once the basic principle of an interrupt has been grasped, even a very short program can produce very impressive results. I hope to demonstrate this, and show how the reader can use the same techniques to his own advantage.

In normal operation, the Spectrum Rom uses "Interrupt Mode 1" to scan the keyboard every 20ms. We want to divert these interrupts to our own routines, so need short machine programs to switch between the two modes. By simply loading the I for Interrupt register with 9 (40 for 16K machines) and turning to "Interrupt Mode

2" the interrupts are diverted to location 65129 (16K 32348), where we place our routine.

In order to return control to the Rom program, all interrupt routines must follow a similar pattern: (i) We must call the keyboard scanning routine, as we have diverted the normal interrupts away from this — *RST 56*. (ii) The interrupts must then be disabled for the duration of our routine, to prevent it being called while it is already in operation — *DI*. (iii) The registers used by our routine must be *Pushed* (saved) then *Popped* (restored) after use to prevent a crash. (iv) The interrupts must be re-enabled — *EI* — ready for next time before finally *Returning* to the Basic system. See Figure 3.

Now, to solve our first problem. The idea is to use an interrupt routine to constantly check the value representing the last key pressed and stored by the Rom program in the system variable *Lastk* (location 23560). We store this value in register A and compare it with 48, the character code for "0". If the actual value is less, all is well and we return to Basic. If it is greater than 48, it is then checked against an upper limit of 58 ("9"+1).

If the value passes the second test, control is returned to the Rom. But, should it fail both tests, then 96 is added to the value in register A, to give the code for the appropriate udg. This is then copied into

Lastk before returning. In short, whenever the user types in a character between "0" and "9" this is snatched away and replaced before the Rom even has a chance to print it in an input line.

The Basic program in Figure 1 demonstrates this routine after setting up as udgs the different letter/accents combinations used in French. With this routine you can write or adapt any word game to work in French, or any other accented language.

To solve the second problem, we need to use *Lastk* again, and two more systems variables. *Errnr*, which holds the number of the current report code minus one, and *Flags*, bit 5 of which indicates to the Rom program that a new key has been pressed. We will also use our own variable *Key*. See Figure 4.

The principle is this — *Errnr* is checked to see if it holds 255 for -1, Report "0 OK". If not, load 232 for "Continue" into *Lastk*, Set bit 5 of *Flags* to "fool" the Rom into thinking this is a new key press, then Set bit 0 of our own *Key* to show that this has been done. On the next interrupt, the routine checks *Errnr* then *Key*, loads 13 for "Enter" into *Lastk* and again Sets bit 5 of *Flags*, finally resetting bit 0 of *Key* ready for the next time that the *Break* key is used. In effect, every time an error occurs, the system thinks that the user has promptly pressed *Continue* and then *Enter*.

This is demonstrated by the Basic Program in Figure 2. Run it and, once numbers appear in the top left-hand corner of the screen, try holding down *Capshift* and *Break* — you will see the *Break* report code and the *Continue* command superim-

posed in the lower part of the screen. Unfortunately, it does not work when *Stop* is entered in response to an input — the report is given, then a number of interrupts occur before the system is

ready for a new command.

As it is a little more complex than the scope of this article, I'll leave the actual coding to you — but the simplest solution is to use another variable like *Key* to enter

Continue three times. Alternatively, there are many other short machine code routines which can easily be converted for use with interrupts. Don't be afraid to experiment!

WRITE YOUR OWN MACHINE CODE ADVENTURES WITH

THE QUILL

The Quill is a major new utility written in machine code which allows even the novice programmer to produce high speed machine code adventures of superior quality to many available at the moment without any knowledge of machine code whatsoever.

Using a menu selection system you may create well over 200 locations, describe them and connect routes between them. You may then fill them with objects and problems of your choice. Having tested your adventure you may alter and experiment with any section with the greatest of ease. A part formed adventure may be saved to tape for later completion. When you have done so The Quill will allow you to produce a copy of your adventure which will run independently of the main Quill editor, so that you may give copies away to your friends. The Quill is provided with a detailed tutorial manual which covers every aspect of its use in writing adventures. It is impossible to describe all the features of this amazing program in such a small space, so we have produced a demonstration cassette which gives further information and an example of its use. This cassette is available at £2.00 and The Quill itself is £14.95.

FOR THE 48K SPECTRUM AT £14.95

Our Software is now available from many computer shops nationwide, or direct from us by post or phone. SAE for details. Dealer enquiries welcome.

Town planning

Ian Robertson presents a high-resolution geography program

I was most impressed with John Meech's geography program for the BBC B which appeared in PCW 1-7 September, 1983. I am, however, one of those (probably few) schoolteachers who are not enamoured of the BBC machine, and I thought that it should be possible to produce something on similar lines (and more colorful — deliberate spelling), on my old faithful Dragon.

I am indebted to Mr Meech for his method of plotting the map using the BBC's *Move* and *Draw* statements, but readers might be interested to realise that these can be reproduced exactly in the Dragon's high resolution modes by using *Draw* "BM x,y" and *Line* -(x,y). The screen parameters are, of course, 255 and 191 as opposed to the Beeb's 1279 and 1023.

A complete character set (*Ch\$(0)* to *Ch\$(35)*), which represents the digits 0 to 9 and the letters A to Z, is included in the program. The digits and letters are in the form of strings which can be used with the Dragon's *Draw* statement, either directly in the form '*Draw Ch\$(x) + Ch\$(y)*' etc in any scale and in any colour, or by extracting characters from normal strings using the *Asc* function to obtain the *Ch\$* number (you have to deduct 48 to get the digits and

55 to get the letters).

The actual shape of the drawn letters etc, I have had in stock for some time. I think they came originally from an American magazine and, if you don't like their shape, they can always be redrawn to suit individual tastes.

Originally, I intended to produce this program using *Pmode4* with black characters and map on a white background, and using the drawn characters in normal scale. Experiments showed, however, that a more impressive display could be obtained using colours and *Pmode3*. In this case, the characters had to be scaled up to retain their correct shape.

I also contemplated including more than one map and set of towns and a menu choice. There would appear to be plenty of memory left in the Dragon to do this. Readers might care to play about with these ideas — what about running it in *Pmode1* and *Pcopying* to other pages? In this way, it should be possible to hold four maps in memory and access them by calling different pages in *Pmode1*.

The actual map and town coordinates were produced using a 15 × 19 grid on squared paper. The line numbers of the grid were (in steps of 10), 105 to 255 horizontally and 0 to 190 vertically, making

it quite easy to estimate the intermediate points. These numbers were chosen to match the right-hand side of the Dragon's screen.

A rather strange thing happened when trying to erase the town numbers and the 'Ok' or 'No' in the lower left-hand box, (Line 2100). I wanted to *Paint* in red on red to a limit of yellow (thus erasing the green letters which were on the red background), but found it would not work. I got over the problem by *Painting* in green first and then in red, but I am still mystified. Perhaps someone knows the answer.

Notes

Lines	
10	Goes to the subroutine to put the character set into array CH\$
20-190	Draws the title page using the character set in various scales and colours.
1000-1230	Sets up the display and draws the map. The words "BRITISH TOWNS" are drawn by extracting in turn from the strings AS and BS (by means of the ASC function) the codes of the correct "DRAW" string held in the array CH\$.
2000-2120 (Main Loop)	Puts the town names and coordinates into arrays TT\$, X\$ and Y\$. Lines 2050-2060 draws each town number in the correct place and alternately PRESETs and PSETs a dot at the town's location. Lines 2070 asks for the name of the town to be spelt. Lines 2080-2120 compare the spelling and flash either "OK" or "No" on the screen and computes the score.
3000-3050	Ending routine.
4000-4380	Subroutine and data for character set.
5000-5050	Data for map.
6000-6090	Data for towns and town coordinates.
7000-7100	Subroutine for instructions.

WALK

48K SPECTRUM

VALHALLA

**MOVI
SOFT**

THE LEGEND

VALHALLA is supplied on a 48K Spectrum program cassette, with VALHALLA player manual and presentation box. As VALHALLA uses the full 48K RAM, microdrives and full-size printers are not supported. ZX printer optional. VALHALLA will be despatched in the week commencing October 2nd. If, for any reason we are unable to fulfill your order within 14 days of receipt, we will notify you.

VALHALLA cassettes carry an unconditional lifetime replacement guarantee.
TO ORDER: (UK Orders Only) Simply complete the coupon, and FREEPOST with your cheque/P.O. made payable to LEGEND (UK Mail Order).
 Credit Card Orders: By phone 9-5.30 Mon to Fri, stating name and address. Card No. and item(s) required.

RETAILERS: Please contact your regular distributor or LEGEND (Trade Distribution) at the address below.

LEGEND (UK Mail Order) FREEPOST
 1 Milton Road, Cambridge CB4 1UY
 (0223) 312453

MOVISOFT OPERATING SYSTEM UNDER LICENCE.

Erased

Hi-res graphics for the 64

Module 3.4.2

This module allows a flashing pixel to be moved around the screen, inking in and erasing individual pixels.

Commentary

Line 11030: X and Y are the co-ordinates of the pixel on the 300*200 screen. The flashing pixel cursor is set to the middle of the screen. The first position in normal screen memory is POKEd with a value which produces a colour indicator of the current mode (black = 0, red = 1, purple = 2, blue = 3). Effects of modes will be explained later.

Line 11040: The state of the screen at the position at which the cursor is to be flashed is obtained.

Lines 11042-11050: The cursor is flashed on and off until a key is pressed.

Lines 11060-11072: In mode 3, pressing the cursor arrow results in the flashing pixel moving 10 positions in the required direction (within screen limits). In modes 0, 1 and 2 the cursor moves only one space at a time.

Line 11075: The unshifted function keys, from top to bottom, are used to set the modes. If the mode is changed the colour indicator is changed.

Lines 11080-11090: If the mode is zero (black) then the pixel at the cursor position is blanked. If the mode is 1 (red) then the pixel is inked in. The remaining two modes allow the cursor to be moved around, slow or fast, without affecting what is on the screen.

Lines 11100-11120: These inputs relate to the next module.

Testing Module 3.4.2

You should now be able to move the tiny cursor around the screen, drawing or erasing.

Module 3.4.3

This module provides for the drawing of straight lines between points defined by the user. It is an adaptation of a method known as Bresenham's algorithm and a version of it is often used in those Basics which have line drawing commands.

Commentary

Line 12025: The values X1 and Y1 were defined when the user input 1 — at that point they were set equal to the X and Y positions of the cursor. X2 and Y2 were set on input of 2. The line will be drawn from X1,Y1.

Line 12030: DX and DY are set equal to the distance between X1 and X2, and Y1 and Y2, plus one. The SGN function means that it does not make any difference if the distance is positive or negative (if it is negative then minus one will be added rather than 1).

Line 12032: The line-drawing algorithm uses the greater of the two differences as the basis of its calculations so it is faster to have two separate routines.

Line 12035: SL is the slope, or ratio between DX and DY minus 0.5.

Lines 12040: The loop is as long as the difference along the X co-ordinate.

Lines 12050-12055: Depending on whether the mode is 0 or 1, a single dot on the line is erased or drawn. Note that nothing will happen in modes 2 or 3.

Line 12060: According to the ratio between DX and DY, SL may now indicate that the

next dot should move up or down the Y axis. If so the Y position is changed and SL is reduced by one.

Line 12070: The slope value is added to SL each time a dot has been printed.

Line 12100: The X position is incremented for each iteration of the loop. Once again the SGN function takes care of lines which move backwards along the axis.

Lines 12200-12250: Exactly the same routine for those cases where DY is greater than DX.

Testing Module 3.4.3

You should now be able to specify a start and end point for a line (1 and 2) then to draw it or erase an existing line, depending upon whether mode 1 or 0 is set.

Summary

This program is intended as no more than an appetiser for the possibilities raised by the bit-mapped mode. Full use of bit-mapped graphics requires some careful thought as to what you wish to achieve and some often complex mathematics to achieve it. Should you decide to go further, the techniques given here, and the functions used to locate individual pixels, will make the task that much easier.

Going further

(1) Why not add a facility allowing the saving of a screen of graphics onto tape — you'll need a fairly long tape but the routine would be simple enough.

(2) Computer graphics books provide a number of algorithms which allow the drawing of circles and arcs. Why not add a module to the end of the program to achieve this — the main drawback will be lack of speed.

This is an extract from *The Working Commodore 64* by David Lawrence, published by Sunshine Books.

THE AMAZING ADVENTURES OF THE
LAUGHING SHARK
 PART ONE

GSH
 Guild of Software Heroes

THE LAUGHING SHARK TORPEDOED TO THE SURFACE ONLY TO FIND HE WASN'T IN THE SUNNY PACIFIC - BUT IN THE DARK MURKY MOAT OF THE.....

CASTLE ADVENTURE
 WITH A THOUSAND DASTARDLY DEATHS - ACCOMPANIED BY THE MAD ORGANIST - PULLING OUT ALL THE STOPS.....

ESCAPING THE DEADLY SOUND OF MUSIC, THE LAUGHING SHARK NARROWLY AVOIDED A CRUISE LINER - IN A MOAT?!!

PASSING A PORTHOLE HE ESPIED NASTY DR. SINISTER PLANTING A BOMB. STOP HIM SOMEONE - OR THIS COULD TURN INTO A.....
DEATH CRUISE!!

NOT WISHING TO SUFFER THE SAME FATE AS HIS COUSIN JAWS, OUR HERO DECIDED TO CONSULT THE ORACLE OF **I CHING**....

THE 4000 YEAR OLD CHINESE ART OF THE HEXAGRAM - WITH ITS KEY TO FUTURE AND THE MEANING OF LIFE.

OVERFLOWING WITH NEWLY FOUND SELF-CONFIDENCE, LAUGHING BOY FELT READY TO HELP PROF. BATTY SOLVE THE PROBLEM OF **LOJIX** AND FIT THE SHAPES —

- INTO THE GRID. IF YOU MANAGE TO SOLVE IT, YOU COULD WIN THE LOJIX POT OF SILVER. 50p X EACH COPY SOLD

DIZZY FROM HAVING TO USE HIS LITTLE FISHY BRAIN OUR INTREPID 'CHUCKLES' GOT LOST AND FOUND HIMSELF IN THE DARK DEPTHS OF **KILLER CAVERNS**..

WITH ITS HORDES OF TREASURE AND DEADLY GUARDIANS... TOO MUCH, EVEN FOR A SUPER FISH, SO HE HOPPED ON A BUS.

AND WENT OFF TO SPEND A DAY AT THE RACES, HAVE A FLUTTER OR TWO, EVEN INVEST HIS WINNINGS IN BECOMING A **RACING MANAGER**

FLUSH WITH HIS SUCCESS ON THE 'GEE GEE'S', SMILEY WAS ALMOST NIPPED IN THE TAIL BY ONE OF THE MOST FEARED CREATURES IN THE UNIVERSE....

A **CREEPER** IN ITS CRAZED QUEST FOR POWER CELLS..... STOP IT OR END CLICHES AS WE KNOW THEM.

HEADING BACK TO SEA, THE LAUGHING SHARK HAD TO AVOID THE ALIEN 'MUNCHIES' NIBBLING AWAY AT A GIANT DAM. HELP! IF THE DAM BURSTS, IT WOULD FLOOD **ENVAHI**

BACK TO THE SUNNY PACIFIC

—TO BE CONTINUED

NEXT YOU MUST NOT MISS.... **DARKNESS ON THE EDGE OF PENCE!**

VIRGIN GAMES GANG

Our **GANG** is growing in numbers all the time, and everybody who buys one of our **NEW GAMES** will **RECEIVE**:

- a year's **FREE MEMBERSHIP** of the **GAMES GANG**;
- **FREE ENTRY** in the next **VIRGIN GAMES GANG DRAW**;
- **6 FIRST PRIZES**, consisting of a **VIRGIN DAY OUT** – a trip on the **VIRGIN GAMES FUN BUS** to the **VIRGIN MANOR RECORDING STUDIO** in Oxfordshire. And then be our guest at the famous **KENSINGTON ROOFTOP NIGHTCLUB, "THE GARDENS"**;
- **50 SECOND PRIZES** of **VIRGIN GAMES T-SHIRTS**;
- **100 THIRD PRIZES** of **VIRGIN GAMES POSTERS**.

VIRGIN GAMES BUS TOUR

VIRGIN GAMES ARE ON THE ROAD! Look out for the **VIRGIN GAMES FUN BUS**. From **SEPTEMBER** onwards our eye-catching double-decker, games bus will **VISIT TOWNS** throughout the **U.K.**, demonstrating our games to the public, in conjunction (where possible) with local radio stations.

GAMES AVAILABILITY

If your **LOCAL RETAILER** is not yet stocking **VIRGIN GAMES** – tell him he should be – but, however, you can **ORDER DIRECT** from **"I'VE GOT NO**

GOOD LOCAL RETAILER" dept., **VIRGIN GAMES, 61-63 PORTOBELLO ROAD, LONDON W11**, enclose a cheque or postal order for the right amount and **DON'T FORGET** to put your name and address – people do, you know!

THE "I WANT TO BE RICH AND FAMOUS" DEPARTMENT

If you have a yearning to be **RICH AND FAMOUS** and have written an **ORIGINAL GAMES PROGRAM**, with good graphics, for any of the popular home computers other than the **ZX81**, **PLEASE SEND A CASSETTE VERSION** (with details) **TO US**.

EXISTING TITLES

Other titles in the **VIRGIN GAMES** range are: **VGA 1003 – SHEEPWALK** by Gregory Trezise for **SPECTRUM 48K** A sheepdog trial in your living room! **VGA 1001 – YOMP** by Terry Murray and Roy Poole for **SPECTRUM 16 & 48K** Command the paras and take on the impossible. **VGA 1002 – STARFIRE** by Martyn Davies for **SPECTRUM 48K** Rid the galaxy

of the Xtardan battle cruisers – a game of strategy and skill. **VGA 1004 – GOLF** by David Thompson for **SPECTRUM 16 & 48K** Championship golf in your own home. **VGA 2001 – BUG BOMB** by Simon Birrell for **BBC B** A skin-tingling new arcade game. **VGA 2002 – LANDFALL** by Gregory Trezise for **BBC B** An exciting and realistic space ship landing simulator. **VGA 2003 – SPACE ADVENTURE** by

R. Thomas and A. Thomas for **BBC B** A graphic adventure set on a seemingly abandoned ship drifting through space. **VGA 3001 – MISSION MERCURY** by Steve Lee for **VIC 20 (UNEXPANDED)** Land your craft on the surface and rescue the scientists... but beware the asteroid birds.

All our fun-to-play games are available from **BOOTS, MENZIES, DIXONS, THE GAME CENTRE, PHOTOMARKETS, VIRGIN RECORDS** and all **GOOD** computer shops everywhere.

To obtain **REVIEWS** of current releases please write to the **"DON'T JUST TAKE OUR WORD FOR IT! Dept."** at: **VIRGIN GAMES LTD. 61-63 PORTOBELLO ROAD LONDON W11 3DD**

Rotating ellipses

Michael Batty explains how to rotate ellipses in the second of a three-part series

Last week we presented programs to draw and fill ellipse shapes which had fixed orientations on the screen. In extending our computer art, we need to be able to rotate these shapes. To do this, we will use standard two-dimensional transformations which change the orientation but keep the scale and origin of the figure fixed. We will generate patterns by regular rotation of ellipses around a fixed origin, forming designs which resemble the petals of a flower, the cogs of a wheel or the points of a star.

The program to draw an ellipse (given last week as program 2) can be used to generate the figure to be rotated, but it is now necessary to store the X, Y co-ordinates of the figure in arrays so that we

can continually transform these points to other positions. The transformations used are quite standard, involving simple sine and cosine functions. They are given in most introductions to computer graphics — Roy Myers' *Microcomputer Graphics* (Addison-Wesley, 1982) is a good reference.

Program 1 shows how this rotation can be done. In fact, if you look at the way we originally generated the co-ordinates of the ellipse (lines 120, 130) and the way we transform these (lines 230, 240), you will see the same transformations are involved. When you run program 1, initially use XX and YY values between 10 and 200, measure TH the angle of rotation or pivot in degrees, and finish the rotation with TH = 0.

We can use the fast fill routine (program 3 last week) to fill these rotating shapes and then we are in a position to develop

some nice formal designs. Program 2 enables you to set up different sizes of ellipse with XX and YY radii and to rotate them regularly from a fixed origin by specifying the number of ellipses — we call them petals — forming the rotation. We then fill the centre of the resulting flower-like picture with a circle. The program is structured as a set of Procedures: we set up the original ellipse using *Procsetup*, rotate it using *Proctransf* and plot a centre circle using *Procsetup* once again. Each time, we fill the ellipse using *Procfill*.

This program can be used to explore a variety of shapes in the time-honoured experimental fashion of computer art. Typical designs are also illustrated. Once you have got a feel for the program, go wild and put in negative axes, and sizes much larger than the screen limits, and you will generate some dramatic effects. Next week, we will conclude by developing a program to elaborate pictures based on these designs. ■

REDUCE PROGRAM FATIGUE with a

BWN PROGRAM COPYHOLDER

By using a BWN Program Copyholder you reduce fatigue, and the risk of strain on neck, shoulder and spine muscles, therefore increasing computer/operator speed and efficiency, also reducing errors (BUGS).

The additional features of the Program Copyholder are:

- A flexible sliding line guide to keep your place on the program/copy.
- A ruler to help measure those awkward spaces in some program lines.
- Can hold firmly a single sheet, magazine or book up to 12 inches in width.
- When not required it can be easily stored flat in a drawer.
- Whether you have a computer, typewriter, Telex machine, composing and typesetting machine or any other keyboard machine, the BWN Program Copyholder will make typing a pleasure.

The BWN Program Copyholder costs only £6.95 + £1.75 p&p. Cheque or Postal Orders to: **BWN Products, 57 Tan-y-lan, Morriston, Swansea, West Glam SA6 7DU.**

OPEN FORUM

Open Forum is for you to publish your programs and ideas. Take care that the listings you send in are all bug-free. Your documentation should start with a general description of the program and what it does and then give some detail of how the program is constructed. We will pay the *Program of the Week* double our new fee of £6 for each program published.

Death Race

on Vic20

This program is intended for people like me; ie, those people who have a warped sense of humour. The idea of the game is to run over as many people as possible

whilst avoiding hazards such as oil slicks, pits in the road, and of course, the posts on both sides. The keys are z-left and m-right, but are easily changed by altering the values in lines 120 and 130.

Program notes

Lines 10 Calls a subroutine to initialise the graphics.

15-20 Initialise variables and move the cursor to the screen bottom.
30-60 Make up the main program loop, the variable E stands for EVENT.
100-170 Print and move the road, and check to see if anything is hit.
200-380 Print a hazard or Print a Pedestrian in which case this routine takes over all functions until the character is off the screen or dead.
1000-2000 Set up the graphics (called by line 10).
3000-3030 Print out the score and if wanted will restart the game.
5000-5010 Produce squelch sound.
6000-6050 Produce skid and explosion sound effects.
The program will run on either the unexpanded Vic20 or Vic + 3K.

Death Race
by J Vanderslims

Tank Battle

on Spectrum

The program is a Tank Battle-type game in which two players battle against each other to score 15 points. The program is structured as follows:

Program notes

10 Defines the graphics
25 Outputs the screen display and sets up an array to contain the positions of the obstacles
80 Starts the main loop in which the direction and whether or not a missile has been launched is determined for each tank.

500 Starts the subroutine to output tank one
600 Starts the subroutine to output tank two
700 Starts the subroutine to output any fired missiles. Also in this subroutine there are checks to see if an enemy tank, an obstacle or a wall have been hit
1500-1570 Outputs the instructions for the program
1700-1750 Contains the routine for the option to re-run the program

MICROTALKER

Speech synthesiser for the

ORIC and BBC

Now you can make your ORIC or BBC speak any word, phrase or sentence using the NEW MICROTALKER.

CHECK THESE FEATURES:-

- Unlimited vocabulary: By using allophones, (the basic sounds of speech, 64 of which are available) any English word can be constructed and spoken and you don't have to be a linguist to use it.
- Simple to program in BASIC. Spoken output can easily be built into all sorts of programs from games to control and educational programs.
- Realistic speech: By using allophones with added inflection highly comprehensible speech can be produced.
- Plugs into USER port on the BBC and printer port on the ORIC-1 thus leaving the main output buses free for other peripherals eg disc drives etc. Uses standard BASIC printer commands on the ORIC-1 thus no special machine code is required to drive the printer port.
- Uses very little memory, most words only require 4 - 10 bytes each.
- No hidden extra's to buy, ie NO extra ROMs, dealer upgrades or special interfaces required.
- Built in amp, volume control and speaker
- Output to HI-FI through 5 pin DIN socket
- Comprehensive 17 page instruction manual including over 170 example words plus 2 demonstration and development programs on cassette FREE!
- Applications include: Games, Education, Warning systems, Aids for the blind or disabled, General communications, Robotics, VDU assistance. In fact were ever a spoken output is preferred or required.

All this for the amazing price of only

£39.95

+ 95p p&p + VAT (£47.00 inc)

CALPAC EDUCATIONAL SOFTWARE

CALPAC LEARNING SERIES

Age: 6 Years Upwards

16K or 48K

SPECTRUM

Programs include:

- Tens and Units Addition • Tens and Units Subtraction • Picture Plotter
- North American Indians • Multiplication Tables • The Romans • Spelling Tester • Homophones • Nouns, Verbs, Adjectives and Adverbs • Verb Practice • The Structure of the Flower • Long Division

► Moving colour graphics and sound

► Detailed correction sequences

► Spelling checkers and "help" call-up facilities

► Adaptable for insertion of your own work, a 48K Spectrum will allow the insertion of over 200 questions and answers

► Feed in your own information and check English, French or Latin spellings

► Draw pictures, maps or diagrams

CALPAC CHEMISTRY SERIES

O-LEVEL

Revision tutorial programs, with detailed correction sequences

Please come and visit us on STAND 140, Hall A, Lower Level, at the:

BRITAIN'S No.1 MICROCOMPUTING SHOW
28 SEPTEMBER-2 OCTOBER 1983
BARBICAN CENTRE, CITY OF LONDON
Sponsored by Personal Computer World

Details of our software may be obtained by writing to:

CALPAC COMPUTER SOFTWARE

108 Hermitage Woods Crescent
St Johns, Woking, Surrey GU21 1UF
or by telephone: 048 67 2584

We have demonstration programs available for retailers

We would like to hear from good programmers, graduates and teachers who would like to help with the expansion of our range on the Spectrum, BBC Model B and other machines. Thank you.

INTRODUCING

Micro Adventurer

If you've ever been killed by the evil goblin, flamed by a dragon or turned to stone by a wizard, then *Micro Adventurer* is the magazine for you. Each issue is packed with stimulating features, such as advice on how to write your own adventures, reviews of the latest games, help for those in need and adventures to type in and play.

And if you want to make the most of your Commodore computer, you need *Commodore Horizons*. Each issue features: competitions with £200 in prizes, pages of program listings, in-depth hardware evaluations and reviews of the latest software.

Micro Adventurer will be launched in October, followed by *Commodore Horizons* in November. And you can get your first copy free by subscribing now. For only £10, 13 issues of either magazine will be mailed to you direct — the normal rate is £10 for a year's subscription (12 issues).

Commodore HORIZONS

Time

on ZX81

Frequently, when designing electronic circuits, a time delay has to be calculated. This can be tedious if the time has to be converted into hours, minutes and seconds and the conversion has to be repeated several times.

This short program for the expanded

ZX81 utilises the ZX81's string handling capabilities in order to calculate the time, frequency, time in hours, minutes and seconds from the values of resistance and capacitance entered as they would be written.

The resistance and capacitance can be entered as 220K and 33N rather than converting to 220,000 ohms and 0.000000033 farads respectively. Also resistances can be entered as a calculation;

for example several resistors in parallel. This also applies to capacitors. These features can be by-passed and the resistances and capacitance entered as 150,000 ohms, etc.

The prefix and time conversions can easily be changed to different units, for example, the time could be extended to days. The print statements could be reduced so that the program will run on the 1K ZX81.

```

Doily

on Dragon

This program draws a doily-like shape with various numbers of nodes (corners). Other adaptations give different patterns and shapes as listed below.

Line 20: This line dimensions the arrays that will hold the horizontal and vertical positions of the nodes.

Lines 40 to 80: These lines collect the details of the shape's size, colour and

number of nodes.

Line 90: This line gives variable D the number of degrees between each node from the centre of the screen (128,96), and puts the screen high-resolution mode 3.

Lines 100 to 120: These lines make sure the pattern is drawn on a contrasting background.

Lines 140 to 160: These lines set up the position of each node (150 the vertical position, 160 the horizontal position), and place a dot in its place.

Line 170: This line increases the angle

variable to separate the nodes.

Lines 200 to 220: These lines draw the design on to the screen.

Lines 230 to 240: These lines hold the pattern on the screen until the space bar is pressed.

Variations	Description
Variation 1. 195 CIRCLE(128,96),R,C

STAR SOCCER

The ACTION game with the thrills of real football

Choose your team formations from 3-2-5, 4-2-4, or -4-4-2.

When the game starts it's up to you to plan your moves and outwit your opponents. See the results played out by fast machine code routines on a birds-eye view of the pitch.

Make the split second decisions that the professionals have to!

Shall I make the short safe pass and maybe let the defence re-group?

Or do I try a long defence-splitting ball and risk an interception?

Has my winger got the speed to take on the full back and beat him?

Do I try a long shot and catch the goalie off his line?

Or shall I give the ball to a team-mate in a better position?

The more games of "Star Soccer" that you play, the more skillful you will become. You'll learn how to set up the goal-scoring opportunities, and how to get yourself out of tight corners. You'll develop your own style of play and find out which formation suits you best.

Side 1 features a SUPER LEAGUE competition

between 8 top British sides. Aberdeen, Aston Villa, Celtic, Liverpool, Manchester United, Rangers, Spurs and West Ham. 28 games in all and the League Table is automatically maintained for you.

Side 2 replays the WORLD CUP finals. It's a knock-out competition between England, Scotland, N. Ireland, Italy, West Germany, France, Brazil and Argentina. Lots of excitement with sudden-death extra time in drawn games.

It's amazing how so much is packed into 16K!

Available for ZX Spectrum and ZX81

(Please state which machine when ordering)

ONLY £5.95

Trade enquiries welcome.

Jungle Picture

on Dragon

This program shows a native playing a drum. Sitting patiently beside him is his

dog. I wrote the program to show that the Dragon can produce good animation, without having to use *Get* and *Put*. The program works by drawing up one picture, and then drawing another one. Although only three pictures are used, the effect is

still pretty good.

Variables used

B\$ Draws the drum
T\$ Draws dog in first position
T1\$ Draws dog in second position
G\$ Draws the ground and shrubs

6,000 FREE TAPES TO BE GIVEN AWAY

Sunshine is giving away 6,000 software tapes — for free. All you have to do is cut out and fill in this coupon, together with the coupons in the next four issues. As soon as you have collected five coupons, post them to:

Popular Computing Weekly Tape Offer
12-13 Little Newport Street, London WC2R 3LD

But, remember you are limited to one tape per person and there is a limit of 1,000 tapes per game.

Rules

- 1) Each entry must consist of five coupons cut from the magazine
- 2) You may only order one tape per person
- 3) There is a limit of 1,000 tapes per game
- 4) No correspondence will be entered into
- 5) No employees of Sunshine Publications Ltd, or their families, will be eligible to enter

Phoenix. Swarms of robot scout birds attack you. Beautiful eggs magically appear, then hatch into deadly Phoenix war birds. Can you survive to face the heavily guarded flagship?

- * 5 screens * 5 skill levels * demonstration mode
- * full sound effects * music * flapping birds
- * Kempston & AGF joystick compatible * 100% mvc

Spectrum PROGRAMMABLE JOYSTICK INTERFACE

- ★ REVOLUTIONARY NEW CONCEPT
- ★ PHYSICALLY MICRO DRIVE COMPATIBLE
- ★ UNIQUE "WIZARD" PROGRAM CARD

SPECIAL FEATURES:

- NO software involved
- NO trailing wires
- NO crocodile clips
- 8 directions + fire
- 2 players
- Take any **ATARI** type joystick, ie: competition pro-Commodore — Star-fighter — Quick Shot — Joy Sensor, etc...

● **TOTALLY** compatible with **ALL** software this interface brings **ARCADE ACTION** in seconds!

To add joystick action to **ALL** your **GAMES** simply plug the interface on to your Spectrum edge connector, set its unique "plug-in" program card and you are ready to bring full life out of your software.

Once easily set for your favourite game, using the quick programming chart, the card (reprogrammed in seconds if required) can be kept with your software. Ready for use at any time.

No reprogramming, messing around with wires or clips needed.

Supplied with: Program Cards and quick programming chart

The best books for the Dragon 32

The Working Dragon 32

A library of practical sub-routines and programs. ISBN: 0 946408 01 7

- "There clearly is a need for books of this kind which provide more than just games" — *Practical Computing*, Sept 1983.
- "It's a good one" — *Personal Computer News*, May 20 1983

The Dragon Trainer

Written as a combined manual and beginners course on the power of Dragon Basic. It is aimed at the beginner and assumes no previous experience of computing. ISBN: 0 946408 09 2

Dragon 32 Games Master

Learn how to write your own top level games. ISBN: 0 94068 03 3

- "If you can't write a half way decent game after this then it will be down to your own lack of imagination. I would recommend the Brains book as the best of this selection." *Which Micro* — Sept 83

Advanced Sounds & Graphics for the Dragon Computer

All the major aspects of the sound and graphics capabilities of this machine are covered in extensive detail. ISBN: 0 946408 06 8

Plus Sunshine Software

Cruising

Quick thinking and dexterity are required to master this high speed chase game.

Look out for the Sunshine range in W.H. Smith's, Boots, John Menzies, other leading retail chains and through our national network of bookshops and specialist stores.

Tony Bridge's Adventure Corner

Adventure problems

This week some more Adventures, and several problems that you may be able to help with.

I don't get many letters regarding Commodore 64 programs — this either means that there are not a lot of Adventures available for the machine, or that Commodore users are an especially cerebral lot (unless you know different...). I don't know what the answer is, but Bob McClement has written to me, asking for help in *Hitch Hiker's Guide*. He can't get past the Great Green Arkleseizure! He is also having a problem in *Will o' the Wisp*, in which the Wizard sends him to sleep and transports poor old Bob to the Room of Sleeping Rocks. Is there another Commodore Adventurer who can help him out of his misery?

A little lower down the Commodore scale is the Vic20, and there is no shortage of letters about Adventures for this machine! They are almost always about the Scott Adams series and typical of these is the letter from Dr. Raymond Wheeler, of Stoke-on-Trent. His wife bought a Vic, and since then, family Wheeler has been immersed in Adventure cartridges.

The Count is the one that Dr. Raymond is currently playing — and he seems to have done quite well too. He has worked out that he needs to smoke a cigarette, and then lay down in the coffin, keeping awake with the No-Doz tablets, and keeping a supply of garlic handy. The Count proves a bit trickier to catch than that, however, and blows out the cigarette before the player can Zap him somehow. The good Doctor (Wheeler, that is!) says that the words *Stairs* and *Roof* are recognised by the program, so he knows there are locations that he has not yet seen — can anyone help him find those locations?

The Scott Adams series is also available for the Video Genie, and *Strange Odyssey* is giving S J Clark a few headaches. Is there life on the other side of the Mining Colony on Jupiter? What is the meaning of the Black Hole? Who are the Novaks? Is it possible to enter the maintenance hatch in the Scout Ship? What is this all about? Please help!

Every Vic adventurer will want to know the answer to the next question: Has Scott

Adams got any new adventures up his sleeve? Well, his company, Adventure International, as well as being modest, is also extremely rich and a powerful force on the US computer games scene (*Get rich. OK — what next?*) they have not got there by sitting on their behinds watching the world go by, and so we can safely assume that they will be working on something.

They are also producers of arcade games (the real variety!) and are the authors of "the world's first interactive war arcade game" which features sophisticated multi-screen, multi-player techniques. This is probably the reason for a long silence on the home micro front.

As to whether we shall see the *Adventureland* series implemented on other micros depends on the impact of those machines on the US micro scene — the Commodore range are the biggest sellers at the lower end of the market, which is showing some resistance to the Sinclair/Timex machine.

In a week or so I shall be looking at Adventure International and the man behind the name.

Now, another Spectrum Adventure, and help needed with *Knight's Quest*, from

already been covered in the Corner. So, for those of you who are not regular readers of PCW, below is a list of Adventures so far reviewed.

Let's finish on the subject of books about computer adventures. To put it simply, there are not many! Butterfield, Parker and Honigmann mention the hobby briefly in their school-fee supplementing *What Is D & D?* (Penguin), and a brief mention is also made in Ian Livingstone's *Dicing With Dragons* (RKP), but, unbelievably, the only book devoted entirely to the subject is *Creating Adventure Programs on the BBC Micro* by Ian Watt, published by Interface.

The book describes how to plan and write your own text Adventure, and includes three programs, along with hints on how to play the Adventures. As many letters I receive ask where books on the subject may be obtained, there would seem to be a demand.

The aforementioned Ian Livingstone, together with Steve Jackson (both highly-respected names in the gaming (D & D dept.) world) has produced a series of books for Puffin, which, although not computer adventure books, may well be of interest. The series begins with *The War-*

And finally:			
23 June	<i>The Top Eight</i>	(in need of an up-date — let me know your top favourites)	

Phipps Associates. Several people are flummoxed right from the start in trying to deal with the Dragon. This Adventure, written by Mike Farley, is one in which the player cannot progress one inch without solving the puzzles at each location — no stumbling about, hoping to fall over the solution (and no peeking at the listing, either, it's all in indecipherable code!). However, everyone seems to want to kill the poor beast on first sight. Just be patient, you will indeed have to kill it, but later rather than sooner! For now, you should really try and make friends with it.

Other Adventurers are stuck later, having solved the problem of the Dragon. Now, I haven't had enough time to get too far in this Adventure, absorbing though it is, so I'd like to hear from anyone who has managed to finish the Quest.

Next week, I shall be looking at some more from Phipps Associates.

Many of your letters ask for a review of a certain adventure and quite often it has

lock of *Firetop Mountain*, and takes the form of solo Adventures.

With the aid of two ordinary dice, and pencil and paper, the player works through the book, taking decisions at each turn of the page on where to go next. Good pictures, and a nice touch of humour, make these books rather interesting.

Finally, if you are one of the many stuck at the final gate in *Pimania*, and wondering how to open it — think about the title, and do a little mathematical cogitating...

This series of articles is designed for novice and experienced Adventurers alike. Each week Tony Bridge will be looking at different Adventures and advising you on some of the problems and pitfalls you can expect to encounter. So, if you have an Adventure you want reviewed, or if you are stuck in an Adventure and cannot progress any further, write to: Tony Bridge, Adventure Corner, *Popular Computing Weekly*, 12-13 Little Newport Street, London WC2R 3LD.

WIN THE POOLS?

48k

SPECTADRAW 2

A Pools Prediction Program for the 48K ZX Spectrum microcomputer. The program looks at the recent form of the teams playing in each week's English and Scottish football league matches and then refers to a large database to see what has happened in the past when teams with similar form met. It can then identify the matches which are likely to yield draws and output suitable predictions.

The program is supplied complete with a database tape containing data on over 7,500 matches and a comprehensive instruction manual.

For £12.95 inclusive (cheques/P.O.s payable to B. S. McAlley).
SPECTADRAW, T COWLEAZE, CHINNOR, OXFORD, OX9 4TD

POOLS PREDICTION

"POOLSWINNER"

The most sophisticated Pools Prediction Aid available. Gives probabilities of score draws, draws, homes or aways, based on two databases holding over 20,000 matches (included). This season's results are provided with the package.

The databases are automatically updated as results are entered.

Can be used in simple mode, or with parameter adjustments to develop your own unique forecast method.

Fully documented, available now for Apple, Spectrum, BBC (B), Commodore 64, Dragon, ZX81 (16K) (others — please enquire).

£15.00 (discs/tapes)

"POOLSDATA"

Complete record of all English Football League matches 1978-83. Teams, scores and dates of 10,000 matches held in simple format, ready for your analysis. Starter analysis programs and full documentation included. Available for Apple, Spectrum, ZX81, BBC, Dragon, Commodore series.

Discs (5 year) £15.00. Tapes (5 year) £12.50. Tapes (2 year) £7.70.

TOP QUALITY DRAGON 32 PROGRAMS

AND ALL BECAUSE... (NEW RELEASE)

£6.95

We proudly present our latest release. A totally original game with an amazing nine screens loosely based on a television advertisement the idea is to get the choccy's to your beloved's home before she arrives. You must risk life and limb by driving, running, horse riding, motor-cycle riding and jumping, hang-gliding, ski-ing, dangling from a ski-lift and parachuting to the scene. With superb graphics sound effects and a high-score chart, the game culminates with an excellent finishing display for those that make it. But will you?

"Impossible!"... Popular Computing Weekly

FREE PARKING (NEW RELEASE)

£6.95

The first full-feature version of the extremely popular board game available for the Dragon. A complete simulation including buying, selling, mortgaging, etc. etc. The program makes full use of the Dragon's colour facilities and incorporates some inspired graphics and sound effects. With options for 2-6 players, continually available instructions and the Dragon as banker, the game is terrific for all the family and there will be no missing £500's!

* SUBMARINE COMMANDER

£6.95

Navigate the seas to find the enemy with this high-resolution colour simulation. Engage enemy aircraft and ships who will try to torpedo and ram you. Depth charges and under-sea mines add to your problems. You are assisted by torpedoes, periscope view, radar compass, fuel and depth gauges with on-screen displays of ammunition and score. Realistic explosions and sound effects alongside identification sheet, home-coming display, hall of fame and graphic reward for beating the high-score makes this program a masterpiece. TRY IT!

* LUNAR LANDER AND RESCUE

£6.95

A brilliant two-part game. Part one is an arcade standard lander which trains you for part two. Here you must rescue lunar engineers in a tortuous cavern. Fuel dump landings and falling stalactites add to the perils of your heroic mission in one of the best Dragon programs available.

"The best version we've seen for the Dragon 32" Dragon Dungeon

A challenging and well-written game Dragon User

Very good Dragon Data

Enclose cheque/P.O. for £7.50 for a guaranteed year's membership (ZX81) or £9.50 (Spectrum). Overseas £2 extra unless with local branch.

PCW BINDER

N Hamer of Buttermere, Greenways, Spennymoor, Durham, writes:

Q I have bought *Popular Computing Weekly* since March and have found it very helpful and interesting. However, as my collection of magazines is growing rapidly, I very much need a binder of some sort to store them. Do you have anything to offer? If so, how much does it cost and where do I obtain one?

Also, my Spectrum has been acting very strangely recently and a local computer club has suggested that it could be the recent heatwave. Do you know if any other readers have had a similar problem?

A This is a problem that we do not, at the moment, have a real answer for. There are a few requests for binders, but not enough to make it worthwhile for us to get some specially made.

However, a friend has just pointed out that W H Smith carry magazine binders for 24 magazines, though apparently they are not in all branches of Smiths.

As for your question about your Spectrum, well I blamed the weather a few weeks ago when the same thing happened to me, but in all honesty, I do not know.

Continuing my policy of 'Quickies' I have been following over the last few weeks, here are some for the Spectrum.

D Marsh of Theydon Bois, wants to know how to test the size of the memory on his Spectrum. Ben Jenkins of Wallasey wants to know the same. B Walton of Whitley Bay knows the answer, but just wants to check if he is right.

You can do this either by looking at Ramtop, which is situated almost at the limit of the memory, or else by entering a *Dim* statement such as *Dim AS (1024,40)*. This asks the computer to set aside an area 40K large, which is, of course, not possible on a 16K computer.

F. Bennet, of Rotherham, Paul Slack of Burton-on-Trent, and someone whose name I cannot read from Nantwich in Cheshire all want to know where they can get a monitor for their Spectrum.

The Spectrum has a non-standard video output. The only monitor that I know of which has an additional special interface for the Spectrum is a full colour model from Microvitec. The cost is £274 + VAT and Microvitec are at Futures Way, Bolling Road, Bradford BD4 7TU.

To end with, both H Harvey of Three Bridges, and Michael Royle of Blackburn, are seeing squares on their televisions after using their Spectrums for a while. H Harvey says he has an issue one model. I wonder if Michael does as well. From your letters, I would say that your computers are crashing because of overheating. There is nothing you can really do except return them under the guarantee.

SINGLE PACKAGE

J Gurney of Saxilby near Lincoln, writes:

Q Now that the Commodore disc drive is cheaper than when it was first announced, I am thinking of getting one in a single package with my Commodore 64, to which I am treating myself within the next couple of months. I understand that it is compatible with the 64, but a few changes have to be made. What changes and is a special interface necessary?

A The Vic-1540 is an intelligent drive with its own Rom and 2K of Ram. The only change needed is with the Rom. The Vic Rom chip will have to be changed for a Commodore 64 compatible chip. It has its own 6502 chip onboard, which means it can format discs while the computer is getting on with other tasks, and of course the Dos is onboard as well.

As long as you ensure that the correct Rom is onboard, then you should have no problem, and it would make a very powerful home system to buy in one go.

DRAGON FORTH

David Freeman of Buckhouse Drive, London N16, writes:

Q I know there is a disc version of Forth for my Dragon, but I have not got a disc drive. Do you know if there is a cassette based version available somewhere?

A Oasis Software of Lower North Street, Cheddar, Somerset, produce a cassette version of Forth. It costs £18.95, and is a variant of Fig Forth. The language is on one side of the tape and a demonstration program on the other. It also includes a comprehensive manual.

OBSOLETE VIC?

A A Morris of Woodward Road, Bury, writes:

Q Please tell me I am wrong. I chose to buy a computer just a few weeks ago. So, after taking the salesman's advice and counting my pennies, I bought a Vic20 at £139.50. Since then I have heard that the top five software houses are going to stop, or have stopped writing programs for it. I was thrilled at first, but now I feel conned. Please tell me and 185,000 other Vic owners that we are not going to become an endangered species.

A I remember being flooded by similar letters when the ZX Spectrum was launched and all the ZX81 owners wanted to know whether or not they would be forgotten. That was a year ago. Anyone who went to the last ZX Microfair would know that the ZX81 is still very much alive and kicking. The reason for this, and why I expect a similar situation with the Vic, is answered in your

letter — 185,000 owners!

While I do not think that the Vic will engender the depth of response that the ZX81 has, I cannot see how the Vic can be written off. If you are happy with your computer, why worry? There are so many programs already for the Vic that I cannot envisage a software famine.

The only thing that might be worrying is what were you told by the assistant? If you were told that the Vic was the latest model, then you were misinformed.

64 COMPILER

Harry Mellish of Killearn, Scotland, writes:

Q I have had a Commodore 64 for a few months and find it much better than the Vic I used to have. I always meant to get a compiler for my Vic, but never did.

But, now I am thinking of getting one for my Commodore 64. I had pretty much decided on what to get when a friend reminded me of something we had both seen a few months ago — an optimising compiler. All I can remember was that it was for the 64 and very expensive. Do you know anything about this? I plan to keep this computer for some time, so if it is worth getting I will.

A An optimising compiler, not only compiles, but also tries to do it more efficiently. Naturally, if the code is compiled more efficiently and compactly, then it will run quicker.

The only such compiler I have seen for the Commodore 64 is Petspeed and costs £125. You were right when you said that it was expensive. However, it comes with a security 'dongle' and has a few additions to Pet Basic, in that it allows the use of long named variable, and extends the *Def Fn* to include String handling.

Petspeed can be purchased from Oxford Computer Systems, Woodstock, Oxford.

Is there anything about your computer you don't understand, and which everyone else seems to take for granted? Whatever your problem *Peek* it to Ian Beardsmore and every week he will *Poke* back as many answers as he can. The address is *Peek & Poke, PCW, 12-13 Little Newport Street, London WC2R 3LD.*

NEW RELEASES

JEEPERS

Despite its lack of memory, people are still buying the Vic20. Presumably, having bought it, they are sticking with it and buying add-ons for extra memory. Most of the new games I've seen require at least 3K expansion — maybe because of the need to compete with some of the spectacular Spectrum programs.

Creepers requires an additional 3K and is one of Virgin's recent releases. You control a space ship which you can move up and down and turn to face different directions.

Your task is, as ever, to blast away the little aliens that bounce up and down in front of you (and sometimes behind you). Although usually they take their punishment like men (well, like aliens), sometimes they rush for you and you must quickly move your spaceship out of the way.

Program *Creepers*
Price £5.95
Micro Vic20 (+3K)
Supplier Virgin Games
61/63 Portobello Road
London W11

DEATH STARE

The latest releases from Phipps Associates are not adventures — bad news for addicts of *Knights Quest* and *Magic Mountain*.

Instead *Black Planet* and *Gorgon*, written by Barry Cornhill of the Aylesbury Computer Club, are what you might call multi-state arcade games. *Black Planet* has nine

stages through which you must pass before you can destroy the *Black Planet* (and get a free badge).

Gorgon is set in ancient Greece — as Spectrasses you must fight Grang and return a stolen chalice to its rightful home.

There are two sections to the game, firstly you fight off the Gorgon (Grang's friend) by reflecting his death-dealing stare back at him/her/it.

Assuming you manage this, there follows a sword fight with Grang. You can parry, thrust, advance and retreat to try and score as many hits as you can. All this within a time limit because (oblivious to the merits of the case) the Gods have decided to destroy your town by flood unless the chalice is returned.

Program *Gorgon*
Price £4.95

ENERGY

Knowing quite what to say about *The Oracle's Cave* is not easy but one thing seems clear — it is the closest yet to a true animated graphic adventure and is excellent value for money.

Like most adventure games, there are secret passages to be discovered and monsters to be fought, but in this program you direct a little man who moves, fights, etc, according to your instructions.

If, for example, there is a cave with a rope in it and you type *u* for up, the little man

jumps up and climbs the rope. The effect is startling at first.

Like other adventures, you have to pay attention to things like combat energy and will have to rest if it starts to fall, but the whole quest has a time limit of five days, and resting (or any other action) uses up precious hours.

Hardened adventurers may feel limited by the single key instructions — no guessing the right words here, but the range of options is still more than I've seen on many text-only adventures.

At £7.95 it makes some adventures (particularly on other micros) look silly.

FUNCTIONS

Compusense has built a good reputation with its range of cartridge based utilities for the Dragon.

The latest addition to the range is *Edit* + a full screen editor for program development.

Existing Basic commands are unaffected, but various new functions are added, including up and down scrolling, specific line *Goto* and find string.

The program is designed to be simple to use. It incorporates the hi-res 51 x 24 screen program within it (a separate manual is provided) and so retails for a whopping £34.50.

Program *Edit* +
Price £34.50
Micro Dragon 32/64
Supplier Compusense

Palmer's Green
London N13 5XA

HEX DUMP

The *Exmon* monitor, which has been available for quite a while on tape, is now available on Eprom.

The Eprom version has a number of extra features. There are register displays and alteration, with disassembler, hex dump and save to file.

Other features include a relocator, and single step tracing of program. *Exmon* is particularly designed for debugging machine code programs and can be included within source code.

Program *Exmon*

PRICE DROP

Virgin Games will be hoping to improve its reputation with its latest batch of games.

Regarding Virgin's Spectrum releases at least, critical opinion was decidedly negative on the company's first offerings.

There are two Spectrum games this time, one is a puzzle called *Lojix*, the other is *Racing Manager*.

The latter seems to be an equine version of *Football Manager*, involving both making decisions about what to spend and graphics of the actual horse race itself.

Looking at the game only briefly, I have to say that graphically it is poor. The selection routines for horses, odds, etc, look slow, although it is apparently written in machine code. Virgin has, however, dropped its prices from £7 to £5.95 for Spectrum games which is certainly welcome news.

Program *Racing Manager*
Price £5.95
Micro Spectrum 48K
Supplier Virgin Games
61/63 Portobello Road

NEW RELEASES

FUZZY

3D programs are nothing new, though the 3D effect has varied from terrible to a grudging not bad. Postern has adopted a different approach.

With *3 Deep Space*, by Mike Singleton, comes a free pair of 3D glasses. Without them the program looks fuzzy and out of focus, with them full 3D effects.

The game itself sounds like the standard space extravaganza with baddies that swoop not only up and down but also in and out of your TV screen.

From reading the blurb on

the cassette, it seems that a reasonable quality television will be necessary for good results, since you have to fine tune the colour/intensity for best results.

Program *3 Deep Space*
Price £7.95
Micro BBCB
Supplier Postern
PO Box 2
Andoversford

TWITCH

Identikit is an educational program from Stell Software. I'm not sure exactly how it is educational, but it is quite good fun.

You design a face from a choice of 'bits', various noses, eyes, etc. Once you have a face you like, it can be saved on tape.

Most of the results are comical and use big graphic shapes. Once the face is finished there is what might be termed a 'twitch' option where you can get eyes to blink, noses to wrinkle, ears to wiggle or (most dramatically of all) everything moving at once.

Program *Identikit*
Price £5.95
Micro Spectrum 48K
Supplier Stell Software

ATTACKED

No prizes for guessing the arcade parentage of *Defend the Cities* from Intersoft.

Missile Command (for this it) is a game in which you defend three cities from repeated attacks. You must destroy not only the bombs as they fall, but also the aircraft which are dropping them.

There are two versions of the Game, one in extended Basic and another in machine code for the mini memory module. Extensive notes come with both versions.

Program *Defend the Cities*
Price £14
Micro TI99/4A (Extended Basic/MMM)
Supplier Stainless Software

DIGGER

Paul Johnston,
author of *Hard Cheese* by
DK 'Tronics

Hard Cheese is a sort of *Dig Dug* (the celebrated arcade game) in which you guide your digger around a field, running away from the standard funny creatures who commonly inhabit such games.

The significance of the cheese may not be immediately apparent, but if you eat it there is a charming rendition of "We plough the fields and scatter".

Killing all the monsters on each frame, either by shooting them or dropping what look like cherries, gets you on to the next frame.

COMING SOON

Like many of the mythical Greeks, Perseus had a hard time of it because of an Oracle.

The ancient Greeks, instead of reading their horoscopes in the daily paper, listened to Oracles who usually predicted dire events.

Perseus' adventures may be more familiar than you think, since the myth formed the basis of *Clash of the Titans* — the most recent Ray Harryhausen film.

To cut a long story short, Perseus can win a homeland and a bride if he can return with the head of Medusa.

Now you can live out the myth as an adventure game complete with Medusa, the lovely Andromeda, various challenges and quests along the way — and garish graphic illustrations at each point.

Aside from the pictures, it is also claimed that the program understands full sentences, eg, "Pick up the sword and go north" like *The Hobbit*. Could be good for Christmas. The programs will be available for the Commodore 64 and the Spectrum (48K).

New Releases is designed to let people know what software is coming on to the market. If you have a new game or utility which you are about to release send a copy and accompanying details to: New Releases, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

Home education

More computer education happens in the home, than occurs in schools or colleges.

With over a million computers in British households (far more than there are in the education system) we have to concentrate on the importance of the home.

Whereas in "educational" circles the BBC computer is supreme, in the home the Spectrum is king. More computer education happens through the soggy keyboard of a Spectrum than through any other, regardless that schools support the BBC. And it looks as if this imbalance between the "official" and "unofficial" education will become worse.

The Spectrum is successful because it fulfils a need, not because someone said they have to use it (not that I am knocking the BBC machine — in fact I prefer it).

The same is true of software, I started to think — always a dangerous sign — what is it that puts Logo, Forth, C, and Basic, into one group and Algol and Pascal into another group?

The answer is that Logo and the others became successful because of the pressure from satisfied users.

Basic became such a successful language because it allowed real people to do what they thought they wanted to do. When ordinary Basics stop doing what people want to do, and as other easily used languages become available, Basic will become less popular. If Basic withers and dies, it will be because users have found a better alternative.

At a recent meeting I attended of the British Logo Users Group (BLUG), there were hundreds of people. They came, not because of some commercial pressure, but because they found that Logo actually did what they wanted it to do.

C, and Unix, are now commercial successes.

But successful because of the numbers of satisfied users who found both worked, and worked well.

In contrast, Algol (60 and 68) and Pascal have never been successes. And never will be, apart from in "education", because they were imposed from above. Once outside "education", the languages were found so unhelpful that they are resounding tinkles.

Personally, I think that many home users will stop using ordinary Basics and will move over to using Logo and (a lesser number) Forth, because they are both languages which do more and are fun to use. One of the few Basics to remain may well be BBC Basic, but then it is rather unlike many more traditional versions.

Forth is now available for most machines (with implementations of varying excellence), and shortly good versions of Logo will be available for most computers. I know there will be versions of Logo available (by Christmas) for the Apple, Atari, Commodore 64, IBM PC, Research Machines, Sinclair Spectrum, and TI-99/4a (a new version).

Note that there is no BBC version likely for some time yet — so schools who have chosen the BBC computer are being deprived of a full version and will have to use stop gaps.

If the school has a Research Machines computer then there will be a version of Logo available, but a version so different from any other that it might not be classed by some as a Logo.

Schools with Spectrums will soon be able to obtain copies of Logo. A very good version it is too, written to the standard of the US implementations.

By restricting the choice of micros in schools to the three manufacturers, with Sinclair being a grudging addition, the Department of Industry has placed schools in a bit of a quandary. Logo cannot be used on most schools' micros.

I always did think that the DoI scheme was a waste of money, especially given the silly restriction on choice. And look what has happened. There was much gnashing of teeth, and pulling of hair, from schools because Acorn were going to be so late with Logo.

Yet, education in the home has not been affected. All those Apples, Ataris, TIs, Commodores and IBM PCs, will soon have (or already have) a Logo implementation. A great language, and much fun.

So will the overwhelming majority with Spectrums.

Boris Allan

Evening walk

Puzzle No 75

We were out walking the other evening from Longfield to Northbridge. As you can see from the map, Longfield is exactly one mile due west of the troll's crossroads and Northbridge three-quarters of a mile due south of it.

After walking along the road for some time, we decided to cut across the heath and make straight for the Northbridge church spire.

If we can walk at a steady four miles per hour along the road, but only three miles per hour across the rough heath, at which point (to the nearest yard) should we leave the road in order to arrive at Northbridge the quickest?

Solution to Puzzle No 70

For a triangle to exist, the sum of the length of the two shorter sides must be greater than the length of the larger side. In the program successively large triangles are constructed with this fact in mind. Note that the area of any triangle is given by the formula.

$$A = \sqrt{s(s-a)(s-b)(s-c)}$$

where a, b and c are the sides and s is equal to half the perimeter $(a + b + c)/2$.

In the program, T is the count and stops when it reaches four. C always represents the largest side, and A the smallest.

```
10 LET T = 0
20 LET C = 1
30 FOR B = 1 TO C
40 FOR A = 1 TO B
50 IF B + A < C THEN GOTO 90
60 LET S = (A + B + C)/2
70 LET AREA = VAL STR$(SQR(S*(S-A)*(S-B)*(S-C)))
80 IF AREA = A + B + C THEN GOSUB 200
90 NEXT A
100 NEXT B
110 LET C = C + 1
120 GOTO 30
```

The sides and areas/perimeters of the four smallest triangles are (in yards and yards/square yards):

- 6, 8, 10 and 24
- 5, 12, 13 and 30
- 9, 10, 17 and 36
- 7, 15, 20 and 42

There are in fact only five triangles possible, these four and the fifth and largest with sides: six, 25 and 29 yards.

Winner of Puzzle No 70

The winner is: Steve Parker, Greenpark Avenue, Skircoat Green, Halifax, West Yorks, who receives £10.
