News Desk

No new Texas machine

TEXAS Instruments has announced that it will not now replace the ageing TI99/4A computer until 1984, at the earliest.

The disclosure has fuelled speculation, following Texas' disastrous recent financial results, that the company may be seeking to reduce its long-term commitment to the home computer market.

The loss-making US company had been expected to announce an up-market TI99/8 machine to compete with the Commodore 64 computer. The 99/8, although not displayed publicly at the Chicago CES Show in June, was shown there to some select customers.

If, as now seems likely, the 99/8 is never produced, it will be the second TI machine within a year to be developed but never sold. Earlier this year TI announced the 99/2, a low-cost silent black-and-

Continued on page 5

Seiko tunes up with micro music

MICRO music is on the way in the form of digital music keyboards, which will connect to home micros.

The first such offerings look like being from Seiko, but other companies will follow suit.

By Christmas, Seiko plans interfaces for its new DS101 and DS202 stereo music keyboards to enable them to be connected to the Sinclair Spectrum and Commodore 64 computers. An interface is already available for the Apple II machine.

These first units will be

quite pricey — the DS101 is the cheaper of the two and will sell for around £400.

It has a standard 61-key C-scale console and offers a choice of 16 voices including piano, organ, flute, brass and strings. Effects include vibrator and sustain.

Additional units — the DS310 Digital Synthesiser and DS320 Digital Sequencer — can also be added to provide more advanced music handling.

At the back of the two keyboards is an interface con-

GIVE YOUR BBC MICRO SOME STICK!

Joystick utility is a very clever program that will allow you to use joysticks with most programs on your BBC Micro Computer.

- ★ Simple to use — just press the keys
- ★ Requires just one block of memory space
- ★ Relocatable in memory
- ★ Sensitivity of joysticks can be varied.

This is an invaluable program that will heighten your enjoyment of your Micro. It is very easy for the beginner to use, but also provides plenty of scope for the more experienced user.

JOYSTICK UTILITY — £5 INC. (DISC — COMPATIBLE)

How to submit articles

Articles which are submitted for publication should not be more than 3,000 words long. The articles, and any accompanying programs, should be original. It is breaking the law of copyright to copy programs out of other magazines and submit them here — so please do not be tempted.

All submissions should be typed and a double space should be left between each line. Please leave wide margins.

Programs should, whenever possible, be computer printed.

We cannot guarantee to return every submitted article or program, so please keep a copy. If you want to have your own program returned you must include a stamped, addressed envelope.

Accuracy

Popular Computing Weekly cannot accept any responsibility for any errors in programs we publish, although we will always try our best to make sure programs work.

Editorial

Home computer manufacturers, particularly in the US, are running scared.

Atari, once the flagship of the industry, lost \$180m. in the third quarter of this year. In total, Atari has lost some \$536m. so far this year, with the fourth quarter results still to come.

Texas Instruments, which has also recorded massive losses this year, is considering dropping its new 99/8 home micro. Mattel has already decided to pull out of Aquarius. Even Apple has run into difficulties with its Lisa machine.

The image of the micro industry as a golden egg laying goose is looking distinctly tarnished, not to say bedraggled. It is no coincidence that the shares of Acorn were not exactly oversubscribed when the company joined the Unlisted Securities Market earlier this month. City investors are considerably more wary about the prospects for micro companies than they were a year ago.

The decision facing companies such as Atari is whether or not they should continue to sustain these huge losses in the expectation of enormous profits in the future. Some companies, at least, seem certain to decide the price for staying in the market is too high.

It will be interesting to see which companies are still around in a year's time.

Next Thursday

Move your spade around the grid picking up as many diamonds as you can. Finish one grid and move on to the next level. Beware, though, you only have three lives. **Diamond Digger** — next week's star game for Spectrum by Jim Provan.

AGF

PROGRAMMABLE JOYSTICK INTERFACE for Spectrum or ZX81

MICRODRIVE
COMPATIBLE

ONLY
32.95
+£1.00pp

ABOUT OUR INTERFACE

The AGF Programmable Joystick Interface is a unique design offering the use of any Atari-compatible joystick with absolutely all software, whether it is cassette or ROM cartridge, with the Sinclair Spectrum or ZX81.

The hardware programmable interface requires no additional software and accurately replicates the keys of the computer in a manner which is responsive to absolutely ALL key reading methods, both BASIC and Machine Code.

The interface does not interfere with key operation and can therefore be used simultaneously with the keyboard.

There is no need to remove the interface once fitted as the rear extension connector will accommodate further expansion, i.e. printers or RAM packs etc. This important feature avoids excessive wear to the expansion port. The key replication principle pioneered by AGF means that your own programs can use eight directional joystick movement by utilising simple key reading BASIC.

Two joystick sockets are provided which share the same keys, for use with the majority of two player games. Several interfaces may be used on the same computer for multiple joystick applications.

The interface is programmed by a two digit code, which is looked up on a programming chart supplied, for each direction and firing button. The two numbers are then selected on a pair of leads which are clipped onto appropriately numbered strips on the interface.

Once configured this can be marked on a Quick Reference Programming Card for storing with the game. As the programming is not power dependent the interface retains the last configuration made and can be immediately used when next switched on.

KEY FEATURES

- ★ Programmable design gives TOTAL software support.
- ★ Accepts Atari, Competition Pro, Wico, Starfighter, Quick Shot, Le Stick etc.
- ★ Rear extension connector for all other add-ons.
- ★ Free demo program and instructions.

PACKAGE CONTENTS SUPPLIED

- Programmable Interface Module as illustrated, complete with clip-on programming leads.
- Self adhesive programming chart detailing how to define which key is simulated by UP, DOWN, LEFT, RIGHT, and FIRE. This can be fixed on to the case of your computer or if preferred the protective backing can be left on. The chart is made of a very durable reverse printed plastic and is extremely easy to read.
- One pack of ten Quick Reference Programming Cards for at-a-glance setting to your games requirements. The card allows you to mark the configuration in an easy to read fashion with space to record the software title and company name.
- Video Graffiti demonstration program which is written totally in BASIC to illustrate how all eight directions and fire can be read. This is also a useful high resolution drawing program.
- 12 months guarantee and full written instructions.

Free kick for 64

COMMODORE claims Soccer for the Commodore 64 is "the most amazing piece of software in the world".

Whether you believe that or not, Soccer is certainly a step forward in terms of animated games.

In it you play a passable imitation of football controlling one of seven players using a joystick. The player you control is always the one nearest the ball. The fire button shoots or, in the case of a defending goalie, causes your

man to jump to save the ball.

At half time the players leave the pitch, to return shortly after and, at the end, a royal-looking figure presents a cup to the winning captain who raises it aloft.

The game is played against the computer or, using two joysticks, against another player.

Soccer will be available, on cartridge, by the end of November. No price has yet been fixed for the game.

Texas

Continued from page 1

white machine. The 99/2 was squeezed out as the US price war forced the existing 99/4A price down into the 99/2's price range.

Recently, also, Texas has dramatically cut the price of the 99/4A and encouraged software support for the machine — moves intended to keep the 99/4A going.

Micro music

Continued from page 1

nection to allow them to be connected to a home micro using an interface which is expected to cost around £10.

This will enable you to store your compositions in Ram or save them out to cassette, Microdrive or floppy disc.

Also, using specially-written software and a printer, you will be able to get a hard-copy printout of the music you have written in conventional music notation.

If the digital sequencer is also connected then it will be possible to program the sequencer switching from the computer, and call it up when required from the music keyboard.

IBM profits up and up

IBM, expected to launch its low-cost Peanut computer in November, has announced a big third-quarter increase in sales and profit.

Hardware sales are up 40 percent to \$5.29bn. and profits have risen almost 25 percent to \$1.3bn.

Sales of personal computer products now account for some three percent of IBM's income.

Mister Microchip, MP

THE Government has been urged to appoint a 'micro-chip' minister to look after Britain's rapidly expanding computer and electronics industry.

This recommendation was made in a report prepared by Sir Ieuan Maddock, former chief scientist to the Department of Industry, and presented to the National Economic Development Office (NEDO).

The Seiko range of music keyboards is distributed in the UK by Roseti, 138-140 Old Street, London EC1.

Shepherd goes for Microdrive

RICHARD Shepherd Software seems likely to become the first company to produce software specially for the ZX Microdrive.

However, the program — *Cash Controller* — will be sold only on cassette, not micro cartridge.

"A program to handle personal finance is an obvious application for the ZX Microdrive," explains Richard Shepherd. "That way it takes less than 90 seconds to load the program and change an entry."

Fantasia converts adventures

BY the end of October Digital Fantasia hopes to have completed conversion of its ten Mysterious Adventures to run on the 48K Spectrum, Commodore 64, BBC and Atari computers.

All are traditional adventures with graphics, written by Brian Howarth.

The next two programs in the series are also well on the way — *Waxworks* is planned for the beginning of November and *Midwinter* should be out by Christmas.

Details of Spectrum and BBC versions from Digital Fantasia, 24 Norbreck Road, Norbreck, Blackpool and Commodore 64 and Atari versions from Channel 8, 51 Fishergate, Preston, Lancs.

The NEDO report suggests that a microchip ministry is vital if the UK's computer and electronics manufacturers are "to be able to face up to competition from the US and Japan."

Yet, *Cash Controller* will be sold on cassette with a save-to-microdrive option in the main program menu.

"Originally we planned to offer the program on Microdrive straight away, but there is no easy way of duplicating large numbers of the micro cartridge. And Sinclair is only offering a trade price for quantities ordered in excess of 500.

"That number is just not realistic at the moment — it's a substantial proportion of the total number of Microdrives so far supplied to customers."

Cash Controller will be available in mid-November, priced at £9.95.

NewBrain goes Dutch

IT now looks as if a Dutch buyer had been found for the ailing NewBrain computer.

Final agreement is expected this week, under which development and distribution of the NewBrain will be taken over by Tradecom, the machine's existing distributors in Scandinavia, the Netherlands, Belgium, Spain and South Africa.

A buyer for the NewBrain has been sought since August, when Grundy Business Systems, its developers, went into liquidation owing £3m.

Lynx winner

TWELVE-YEAR-OLD Alan Broady, from Coventry, has been selected as the winner of our Lynx competition, held in August.

In the competition, we asked readers to send in their ideas of what their ideal computer would be like.

Alan's ideal machine included a flat-screen colour monitor, offering a 1,000 × 1,000 resolution in 'Super Mode', joysticks connected to the computer by a radio controller rather than conventional lead, a range of built-in processors including Z80A, 6502 and 6809, together with a selection of seven high-level languages.

Other special features included voice input and the ability to receive data broadcast directly from satellites.

As winner, Alan receives the prize of a Lynx computer.

Symbolic problems

As a total newcomer to home computers and computing, I buy your magazine regularly to try and get some idea of what's what.

Although I do not own a computer yet I have the occasional use of a friend's Spectrum, and I am already an addict. I would be grateful if you can help me with a couple of problems.

My first problem is *symbolic*. In your issue dated 22-28 September (Vol 2, No 38) you published a game called *Harrier Pilot* by Colin Jones. On line 260 it says Inverse 1 then a black blob, am I right in assuming that this blob is the number 1 printed inversely? In the same vein, in the issue of 29 Sept-Oct 5 (Vol 2, No 39) you have *Centipede* by Jim Provan. There are some strange symbols in this also and I would love an explanation.

After using up so much space, I've hardly got the nerve to mention my other problem, but here goes.

When I eventually get my computer, one of the uses I want it for is cataloguing a huge number of books (my collection). Can you tell me (in language I can understand) how to go about it?

The type of format I require is something similar to a list of phone numbers, names and addresses: ie Bill Smith 16 Black Road 632 0103.

I know I'm asking a lot, but I really am stuck and would appreciate your help.

G H P Springer
50 Severn Drive
Garforth
Leeds
LS25 2BB

All the problems you have understanding symbols can be traced to one source — user-defined graphics.

The Spectrum like many other home micros allows you to define certain keys with a shape of your own design and then use this shape within your programs.

All the programs you mention use this technique, which is quite well explained in the Spectrum manual. Usually a programmer will tell you what key he has assigned each shape

to; ie, you will see something like: Line 20 Graphic E, Graphic B, Graphic A. What this means is that when you enter this line and come across a user-defined shape you should go into Graphics mode and press E, followed by B, followed by A.

To begin with you will just see the letter but when you run the program you will find it has changed into the tank, centipede, or whatever the game requires. If the programmer does not tell you which key is which, then just press any key (A-U) when in graphics mode, and after you run the program put the right graphic in the right place. You can find out what graphic is assigned to which key by simple trial and error — go into graphics mode and press a key until you find the shapes.

Regarding your other problem, what you require is a uni-file or vu-file type program. You could either buy a commercial package; Psion, for example, do *Vu-file* or you could use David Lawrence's *Unifile* which can be found in *The Working Spectrum*, published by Sunshine Books.

High score table

After reading this week's publication (6-12 October), I felt I had to comment on the matter of a games high score table. You said that there were two problems in doing this, (a) you would not know if the score was genuine, (b) you would not know which games to include.

Well, I have the solution to both these problems. To check that the score was genuine you could insist on either a screen dump on a printer or a photograph of the screen. A good game for each computer could be used, such as *Donkey King* for the Dragon and something like *Penetrator* or the highly rated *Jet Pac*.

If you are not satisfied with my second solution, then run a poll for a couple of weeks and find the most common games and use them. I am sure this would be a large incentive for users to buy the weekly to see if their name is up in lights.

Jonathon Whitehouse
18 Lebanon Gardens
Biggin Hill

Kent
TN16 3HB

PS I think *New releases* is 'trif'.

While not infallible, a screen dump or photograph would go a long way towards authenticating high scores.

We would be very interested to know what other readers think of a high score table and which games should be included.

Joystick interface

I have been interested in buying a joystick interface for my Spectrum for quite some time. The only thing that has been putting me off is the fact that only specially adapted programs will work with the particular interface, which limits the amount of software that may be used with it.

Naturally, I was interested in the announcement of the Sinclair Interface 2 which acts as a Rom cartridge and joystick port adaptor. What I would like to know, is will future software, allowing the use of joysticks, be written so that it may be used with the Sinclair joystick interface?

Or will it be that only some programs will work with the interface as is the situation now with other interfaces? Also, will I be limited in the range of joysticks that I would be able to use with the interface?

I would be very grateful if you could answer these questions for me, as it could decide whether or not I buy a joystick interface for my computer.

PS. Your magazine is great. Keep up the good work.

PPS. May I also add my plea to the numerous others for a machine code series for the Spectrum?

S Ryatt
190 Nestles Avenue
Hayes
Middlesex
UB3 4QG

We've been trying out several programs with our office interface. A lot of existing software does not function with it as it does not use the same values as, say, the popular Kempston interface.

However, the major software houses like Psion and Quicksilver already have most of their software compatible

and the other companies are expected to follow suit.

The Interface 1 requires a standard Atari type end connector and, so far, every joystick we've tried with this type works correctly.

Video video

I own a Spectrum 48K, a video and a video camera. Is there any way (except from using the video camera) to record the picture my Spectrum produces?

I find using the video camera the picture isn't very good quality. I would like to know how this is done, because I would like to combine my computer picture with some normal filming. Please, please, could you tell me how it is done?

Kevin Jenkins
6 Bishwell Road
Gowerton
Swansea
SA4 5AU

We ran an article explaining how to generate video titles on a BBC Micro in *PCW* 15-21 September. Unfortunately, the Spectrum does not possess UHF or video output sockets, so you would undoubtedly need an interface of some sort.

Unfair answer?

Thanks a lot for your 'Just a nibble' article on the letters page (*PCW* 20-26 October).

Some of us who are computer newcomers (and who don't even own a computer yet) worked very hard reading the first five issues of *The Home Computing Course* in order to find that very answer for their competition. You seem to have unwittingly given the less studios amongst us an unfair advantage (mentioning no names).

I know all's fair in love and war, but at love and war you must make some effort yourself.

G Gilmore

Bug Attack

A new game for the Dragon 32 by Mark Sach

The object of this game for the Dragon 32 is to build a brick wall around the queen bug. You do this by picking a brick up at the bottom of the screen then, dodging the bugs, you take it to the top of the screen and put it around the queen bug.

Elementary, Dr Watson

David Kelly talks to Philip Mitchell, author of *The Hobbit* and *Penetrator*

Notwithstanding the several thousand miles separating him from us, Philip Mitchell still manages to exert a powerful influence on the British computer games programming fraternity.

As author of *The Hobbit* and *Penetrator* his name often comes up in conversation mentioned in hushed tones.

Some people are born with computers in their blood — everything they touch turns into bits and bytes. And Philip is one of these. He first got interested in computers seven years ago while still at school — and he built a few, designing the circuits himself.

Then to Melbourne University and a degree in computer science. While there he worked mostly with main-frame machines, but did a lot of programming micros in his spare time.

"You name it, I've probably built it — 2650, 6502, Z80, 68000," he says. He thinks a good hardware knowledge is an invaluable asset for a programmer: "People who have a background in that side seem to have more of a feel for machine-code because they understand more of what is going on."

Strangely, Philip feels more at home programming in machine-code than Basic.

While still at college, he was recruited by Melbourne House's Fred Milgrom as one of the team to produce an adventure game based on a book by JRR Tolkien. So began *The Hobbit* adventure.

To begin with three people were involved — Philip, Stuart Ritchie who developed the text interpreter, and Veronica Megler who worked on the design of the characters and locations.

When the three finished college *The Hobbit* was still not completed. Stuart and Veronica left the project and the whole program was dumped on Philip's lap when he joined Melbourne House full-time.

All the work that had been done on the program had been written for the TRS80, so, as well as finishing the program, Philip had to convert it for the Spectrum. Even though Philip no longer writes for the TRS80 he still uses it for all new software development.

Now he is working on the follow-up to *The Hobbit*, based on the characters from Conan Doyle's Sherlock Holmes books.

In the adventure, you, as Sherlock Holmes, find yourself in the company of a corpse, faced with the task of finding the murderer and convincing Inspector Lastrade of Scotland Yard to arrest the culprit. "The Hobbit was a starting point. What I want to do is take it a stage further. One of the attractions of *Sherlock Holmes* is the very involved personalities of the characters — particularly Inspector Lastrade and Dr Watson.

"We have now compiled an amazing amount of information. Although the prog-

ram will not be based on any one story, we are trying to stick as closely as possible to the spirit of the original books."

Because the plot is a detective story there is a lot more communication required between the characters — particularly with Lastrade.

The original *Hobbit* program was in two parts: The central routines which drive the program — some 17K of machine code — and a database which defines the plot, locations and characters.

For the *Sherlock* program an entirely new database will have to be written. Also, the part of the main core program which deals with interaction of the protagonists and language analysis is being considerably extended. This is essential so that you, as Sherlock Holmes, can discuss your ideas with Lastrade and interrogate possible suspects.

Sherlock Holmes will have fewer locations than *The Hobbit*, but with many more objects and people to meet who will be able to give evidence.

At this stage it is not clear if the program will have room for any graphics — memory limitations are Philip's main problem.

"It is very frustrating at times. One of the advantages of writing on the TRS80 is that I can write the program and compress it down later.

"As each new part of the program is incorporated into the main game it is rewritten several times and in the process the routine is refined."

Philip writes first in source code using an off-the-shelf editor/assembler package for the TRS-80. *Sherlock Holmes* is now about 10 times the size of the Spectrum's memory, but when that is compiled into machine-code with a lot of squeezing it should just fit.

Until now Philip has been working mainly on the personalities of Lastrade and Watson. "In some ways Watson is an equivalent of Thorin in *The Hobbit*. But Thorin was a pretty static character — apart from singing about gold there wasn't much to him. Watson will be much more complex."

Much of the inspiration for the programming of the Dr Watson character comes from the famous *Eliza* program. Watson reacts to everything that is said to him — reforming what you have said into a question or coupling what has been said in a sentence, together with something that has been said before.

In regard of the Lastrade character, Philip says: "I haven't decided if he will remain in his office or wander about the game. If I let him roam free then, before you could ask him questions, you would have to first find him."

Trying to enhance the level of communication between characters in the new

adventure has taken Philip into the field of Artificial Intelligence (AI).

"I don't think we will see much advance on the sorts of things being achieved now in 8-bit micros. There is just not enough memory, and for AI the processors are too slow.

"When we have 16-bit machines with half a megabyte of memory, then there will be a lot more scope for AI in adventure games. I am currently working with the 68000 processor in my spare time and watching and hoping.

"In my opinion it is the easiest 16-bit chip to program and certainly the most powerful. The reason for this is that its main instruction sequence was designed by a programmer and not an engineer.

"If someone was to produce a micro based around the 68000, designed primarily for speed and high-resolution graphics, then I think we would see some amazing games produced."

At present, adventuring seems to be splitting into two schools. From *The Hobbit*'s mixture of text and graphics things are either moving towards all-graphic games with some animation, or more complex adventures with advanced text handling and language interpretation, but no graphics.

"When the 16-bit machines with more memory come," says Philip, "the two strands may converge again to produce a truly interactive game."

His deadline for *Sherlock Holmes* is January, when it is hoped to launch the new game for both the Spectrum and Commodore 64 machines.

He is not looking forward to converting the program for the Commodore 64: "Converting *The Hobbit* was a horrible job — I'm not as comfortable with that machine because in my view the 6502 is an inferior processor to the Z80.

"The processor is older with a very simple instruction set — what takes one or two instructions on the Z80 takes four or five on the 6502 — it's very frustrating."

If all goes well both versions of *Sherlock* should be available by the end of January. "If the final game adventure lives up to my claims, then I hope we will have another winner," Philip says. ■

Never say die

Mike Grace battles with a mini-kong in his latest review of Vic20 software

One of the fears of micro computer owners must be the disappearance of either the hardware or, more significantly I suspect, the software. The computer world is notorious for fortunes that are made and lost in the twinkling of a line feed (you only have to watch the cover of *Popular Computing Weekly* to see that), and even an investment of £100 can be pretty tiresome if there's nothing to play with or use in the way of software. So — I thought to myself the other day — how about my slightly battered but lovable Vic?

Earlier this year, Commodore held an exhibition. You may have heard about it, you might even have gone along as I did. And one of the things that struck me, as I jostled through the crowds, was the amount of software for the Vic20 which seems to be growing and growing. Even if Commodore does stop production (as I've seen suggested in the press), it seems we owners have no fear of software drying up.

Jupiter Defender from Interceptor Micros for the unexpanded Vic is our old friend *Defender*. Described in the blurb as "... an invaders program written in machine code with high resolution graphics" it certainly is fast, with lots of noise and action as the familiar ship skims along the planet surface — but graphics? Very elementary and amateur.

This brings up a point — just how much do graphics really matter? I tend to judge a game by its graphic quality and its presentation — but not so my nine-year-old son. To him, ease of use and 'zapability' are more important, and he tends to pick *Jupiter Defender*. The ship (poorly drawn but who cares) skims along with aliens, blobs, evil-looking ovals and fiendish red spots all trying to annihilate it as it fires at will, bumping up the score. Listening to his cries of delight and achievement on getting a higher score, or just getting through the deadly hail of red dervishes, makes me realise that not all games appeal to all people. Well, why should they? *Jupiter Defender* isn't for me, but as this style of game goes it is obviously addictive and more than adequate.

I'd give this game a score of six (out of 10) because it does appeal to the younger audience so well. An interesting additional feature is the ability to destroy everything on the screen by using a 'smart bomb' (that means you press any key and all the baddies on the screen are destroyed, giving you a few moments respite). Packaging and instructions are adequate. Great fun for younger players.

Next let's look at another game for the unexpanded Vic. Anirog produced a 16K version of *Krazy Kong* which I reviewed some time ago, but now they've compressed their game into a *Mini-Kong* package for the 3.5K configuration incorporating the

first screen of the 16K version only. The graphics are virtually identical to the original, with the same little man wearing a striped jersey (his girlfriend looks exactly the same except her jersey has different colours) trying to dodge the barrels and get up to Kong.

One of the problems with this game is the difficulty — it really is hard. Trying to jump on the lift involves extreme delicacy of touch, as if you press the joystick too hard you splat, whilst dodging the barrels from above. These barrels come down with incredible speed (without Kong doing much it appears) and to be honest the task seems nigh impossible.

Anirog always have excellent displays, including a clock ticking away the seconds, your score and your lives. Kong tends to look like a slightly constipated gorilla, but the lift and the ladders look very good.

This is an excellent version for the player who hasn't expanded his machine yet and it amazes me how so much is squeezed into that tiny bit of memory. You've got an expanded screen, a lift, and a handbag bonus (there's something slightly odd about this Kong thing I've decided) as well as a high score table. And all this for £5.95.

Next I turned to something called *Slap Dab* which is based on an arcade game called *Painter*. I am definitely not an arcade fan, so I *Loaded* this without any idea of what was to come except that the advertisements had talked about fast action, strategy and giant insects. Sound-ed good!

On *Loading* I skimmed the instructions (a spelling mistake and rather poorly displayed text made a bad first impression), but as soon as the game started I found it both delightful and (a vital point for a slow player like myself) easy to play. The essence of the game is that you have control of a little man who moves across the screen, painting in the background white as he goes. At intervals his pot of paint runs out and he has to return to base to refill, but there are one or two nasty insects (who seem to look just like our hero) who have to try and zap you.

Strategy is involved as well as speed, as you can trap the insects (they can only move on painted areas while you can move anywhere) and the game isn't too hard at the first level of play.

At £5.95, this seems good value and I wanted to play this just for fun after I'd finished the review. When you start, the insects move fairly slowly, but as you progress through the levels of skill the baddies get quicker and (it seems) smarter. I found the response to the joystick excellent and the graphics adequate. The sound effects enhanced the game, but I did find that at times zappy noises were happening and I wasn't sure quite why or what misfortune was about to befall me. The concept of the game was new to me and I liked it.

Now we move on to the 16K games, the first of which is *3D Time Trek* and is modestly priced at £6.00 for what is an enjoyable and visually stunning combination of *Star Wars* and *Star Trek*. The cover shows a dramatic science-fiction scene of three men aboard their star ship watching a star 'go nova', or an alien ship exploding (presumably the latter). This represents the feel of the game exactly once you start playing.

You are faced with a beautiful blue background and a realistic console with perspective drawn in (hence the 3D of the title) so that it really looks like the bridge of the *Enterprise*. The centre of the screen

contains a monitor, which will display either instructions (in enhanced lettering to better the visuals) or a view of space outside your ship (this becomes very exciting once you engage the enemy). Various keys give you the usual display of galaxy map, long-range scan, damage report, etc. My review copy contained inadequate information on the cassette sleeve as to which key to press (a printing error I presume, but if you get one of these

duff covers press 'M' to obtain the galaxy map).

What sets this game apart from the other versions of *Star Trek* I have seen is that, once you engage the enemy, instead of an unseen battle taking place you actually move into real-time visuals. On the centre monitor a tiny dot appears, enlarges into a cross, and finally into a head-on view of an alien ship.

As it comes closer it moves across the screen, dodging and weaving — because you are equipped with a joystick (of course) and must fire as soon as the alien hits the exact centre of the screen to blast him into smithereens. Amidst flying debris and explosive sound effects, you are now able to move on to the next segment in space.

I found the game extremely enjoyable, perhaps not quite as intellectually satisfying as some other versions of *Star Trek* but much more fun. As with many other Anirog cassettes I was really taken with the graphics, and at first I actually thought I'd have a chance of winning. But as I sit here, firing madly at the approaching aliens, I'm losing energy — fast — and then the blighters damage the shields and — lost again!! It would be nice to win through just once in a while ... Still, at £6.00 — who can complain.

Galactic Abductors is another 16K game with a science-fiction theme, priced at £7.90. This time deadly space hawks (stunning graphics, or as Jeff Minter might say — awesome!) come winging over the horizon to wreak havoc on your planet of little matchstick men. All you control is a laser gun, patrolling along the bottom of the screen. Your gun can fire upwards and sideways (a neat trick this, involving pulling the joystick back and to the left or right prior to pressing the fire button) and the hawks swoop down and flap quite eerily across the stark black alien sky (dotted with a few stars which really do twinkle).

It seems the hawks have a burning desire for people, for they will carry off your matchstick men if you don't stop them and, if you cannot fire and kill them in time, then just a skull falls to the ground (I'd hate to think what happened to the matchstick man). However, just to keep you on your toes, the hawks also drop little 'homing

mines' which fall to the ground and come sidling along the flat towards you.

The game is both fast and enjoyable, although I seemed to find it impossible to destroy any of the hawks by firing at them, they just changed colour. What did impress me was that after the preliminary wave of hawks they would all disappear and the screen would go very quiet. It seemed as if we were waiting for something terrible to happen. Sure enough, after a few tense moments, the hawks reappeared from behind the mountains to attack again — with a menacing swooshing noise that started quietly and built to a crescendo. Good, atmospheric stuff! Another winner from Anirog.

Now, just in case you think I can't say anything against this company, I have to confess I do not like their next game *Zok's Kingdom*. Billed as a graphic adventure, this is really a visual attempt at setting a lot of puzzles for our little stick man inside a number of rectangles (called rooms). The game is for the expanded Vic (16K) and costs £5.95. It has a terrific title with dramatic lettering, sound effects, and a castle with bats fluttering in the sky, but when it comes to the actual game — for me it doesn't deliver the goods.

After the title there is a page of text explaining you have crashed on a planet belonging to a relative of Dracula, a chap by the name of Zok! Now you have to enter his Kingdom if you dare. Presumably you

do, having just paid out your money.

The rule in any adventure is to pick up objects, and in this type of game it's the same. One of the problems is that quite often you won't know what the object is, as all you see is a square or oblong shape which disappears once you manipulate the little man beside it — but you pick up just the same. Having said that — take care, as one of the objects somewhere inside the castle is a box which electrocutes you without any warning. Once into the castle proper, you must manoeuvre past a nasty looking guardian called Dagon. Having done that, you now move along picking up various keys to allow you to enter rooms.

It's all quite amusing, but I didn't find it stimulating at all (unlike text adventures). I also found the necessity to keep going back and forth along endless corridors and mazes a trifle tiresome.

As I often do I've saved the best game till last. *Matrix* by Jeff Minter of Llamasoft has to be my favourite of the batch. For the 16K expanded Vic and priced at £6.00 this is a zap, pow, shoot 'em quick, style of rapid "What the heck is going on" type of game that has just caught my fancy. Graphics are very good, and the noises are splendiferous.

It seems that some nasty aliens are back with a vengeance to get us, and we have the obligatory spaceship with lots of fire-power to try and get us out of the mess. In fact there's a whole heap of history in the instructions about it being ten years since the grid wars and you're called to base because the 'droids are back, etc, etc, but that is all a bit above my head. What I do like is the action, and the fun.

Once you get into the game (after a neat title sequence) a terrific red grid appears on the screen and baddies start appearing all over the place looking like snakes, ships, saucers, whatever. I just shot about firing like the future of the earth depended on it and at times they got me and at times I got them, but it was all so fast I never really quite knew where I was. One exceptionally useful facility is that you can pause the action — and return to the game later.

You start with five lives, and when you win you get an extra life (nice that!). Another feature I liked was that if you cleared a zone and moved to the next and then lost a life, you didn't automatically go right back to the beginning again as many other games do — you just started again in the higher zone. There are 20 skill levels (for real players) and plenty of weird and wonderful effects like the Zappers and the dreaded Y beam to enhance play. This is a smashing game, lots of fun, and my pick of the review.

Finally, for those of you with long memories I ought to say that in my last review I left Anirog's game *Xeno II* only partly reviewed as I hadn't mastered more than level 1. I can report that I've now got into level 2, but once again it's so hard I can't get any further. Watch this column for more news next time.

Modified functions

Clive Newton explains how to redefine the Lynx keyboard to your own requirements

The Lynx Micro has several attractive features, but one of the most useful must be that of being able to modify the machine's functions by altering addresses or variables in the system table area.

The accompanying program allows Lynx users to define their own single key entry command set (see page 80 of the manual). This is made possible by altering the values of the system variables at locations 25146 to 25171 which represent the commands associated with the keys A to Z. The value at each location represents the command token which is the position minus one, of the Basic command in the Basic syntax command table.

The program, when Run, constantly displays the single key set-up (on the keys A to Z) on the top two thirds of the screen. The bottom part of the screen is responsible for displaying the menu, or the sequence of operations once a menu option is selected. The menu gives the user a choice of four options:

- (1) Alter the table set-up
- (2) Reset the table
- (3) Save the modified table or
- (4) Exit from the program

Selecting the first of these, the user is asked to input the key (A-Z) that is required to be altered (the program will return to the menu if an invalid input is entered). The user is then prompted for the new command to be associated with the previously defined key. All command inputs are checked for validity. The program then updates the system variable associated with that key, with the correct command token.

You will notice that the standard single key entries are printed on the screen in

yellow and any modified commands are printed in red. Exit from this option is achieved by pressing any other key apart from Y when asked whether further updating is required.

The second option resets the computer with the standard command set that the user has on switching on the machine. This is done by copying the table that is held in the Rom, from location 5985 onwards. While the machine is resetting the table, an arrow will flash next to the reset option on the menu, and will disappear once that option has been completed. Once the program has been cleared from memory, the standard command set can be reset by using the command *Call 1*, which is easier than pulling the power plug.

The next option will save the 26 bytes representing the modified command set by using the *Save* routine in the Rom, utilised by the monitor (ie, in connection with the *D* option). The table will be *Saved* using a program name of *Tablen* where *n* is the version number, you specify on entering the routine, ie, if you specify version 0, then the program name will be *Table0*. This program name is printed on the screen once the computer is ready to start saving. The tape recorder can be switched off, once the bottom part of the screen starts clearing.

Now, using this saved command set, you can easily re-enter it, by using the command *Mload*, eg, *Mload "TABLE0"*.

The final option (exit program) will reset the text window back to the full screen size, whereupon the screen will clear as will the program, but your modified command set will remain until you reset the machine.

Looking at the program listing, you will notice that there are four machine code routines held in the *Code* statement lines, 700 to 730 inclusive. They are called using the command *Call Lctn* (line number) and

each routine's function is as follows:

- Line 700 — Copies the 75 commands from the BASIC Syntax table in the ROM, to the appropriately dimension array, *AS*. This is done to simplify table output and also to do away with data statements.
- Line 710 — Once you have chosen the command you wish a key to be modified to, this routine will check its validity, and will return the respective command token in *HL*.
- Line 720 — This routine is responsible for clearing the bottom third of the screen and resetting the cursor position in the correct place.
- Line 730 — Responsible for saving the modified Command Set, with the correct program name.

The program revolves around the very useful facility in Lynx Basic, of being able to pass parameters to declared procedures — the main procedures being those of *Ink* and *Alter*. *Ink* works out the correct colour the command should be printed on the screen, ie, either yellow or red. *Alter* is responsible for modifying the appropriate system variable and also prints the new command in the correct colour and position on the screen.

The character in lines 75 and 685 (underscore) is that representing *Ascii 95* and can be accessed on the Lynx keyboard by going into graphics mode and using *Shift?*. For line 670, I printed Lynx using the defined characters in the graphics set ((*Shift*) *STUVXY*).

Finally, for those of you who have disassembled the machine code routines in this program, you will come across several system variables whose function you probably will not understand as they were not documented at all in the Lynx manual:

- 25145 — The state of the keyboard (SHIFT LOCK on or off or whether you are in graphics mode). Poking this with the value zero (line 50) forces upper case (i.e. SHIFT LOCK on).
- 25172 — Horizontal print position.
- 25173 — Vertical print position.
- 25113/4 — Address of the start of the BASIC Command Syntax Table (ROM).
- 25084/5 — Address of the end of BASIC program. ■

Keep the flag flying

David Bark looks inside the Z80 chip to see the various flags in action

This program uses a simple 135 byte long machine code routine from address 32100 to 32135 to store all the Z80 register values into addresses 32000 to 32021. A block of 20 bytes, from 32152 to 32171, is reserved in the middle of the routine for single commands or a short routine to be inserted and tested. Any of these bytes not used are filled by zeroes.

The register values are then *Peeked* by the Basic program and displayed on screen. The flags register has the individual flags shown as flashing when set or steady when reset.

All commands or numeric values must be entered in hex or decimal. There are some commands which will crash or lock-up the program if used carelessly. *Pushes* and *Pops* must be equalised so that the *SP* is returned to its original value. Exchange instructions must similarly be equalised and, for some reason, the alternate registers may not be altered or the program locks up.

No doubt there are many other commands or routines which will cause similar problems. *JP* and *JR* instructions may be used, but must be kept within the 20 byte limitation.

Despite these restrictions, the program has proved to be very instructive when trying to understand exactly what is going on inside that infamous Z80 chip. The reactions of the various flags can now, at last, be seen in action!

Part of the main program is a hex loader (lines 1610 to 1710), so these lines can be modified to type in the hex listing and then altered to fit into the main program. If you have a hex loader on cassette, *Load* it from address 32100, if not type in listing 1 and *Run* it to enter the hex codes in listing 2. The codes should be entered one complete line (8 bytes) at a time; ie, the first line would be entered as: 'ED4B007DC5F1ED4B Enter' which will give you a neatly laid out screen display exactly matching the list for easy checking.

If you find an error, simply make a note of the address at which it occurs and the correct entry, and carry on. Type *S* to finish and then look up the decimal values of any errors and *Poke* them in as direct commands at the end.

Once the hex is in, alter the hex loader by referring to listing 3. Remember to enter line 1655 and then type in the main program from listing 4, ignoring lines 1610 to 1710 which you already have.

Now enter *Goto 5000* and *Save* and *Verify* the program. Remember that you will have to "Press any key" twice, once for the Basic and again for the machine code.

Enter *Goto 10* (if loaded from tape the program will auto run) and wait 15 seconds

or so while the UDGs are formed and the *Peeks* and *Pokes* are carried out.

The display, when it arrives, will show the zero, half-carry and parity/overflow flags as flashing (set) and the rest, in the primary set, as static (reset). The two unused flags (bits 3 and 5) are not marked, but will flash if they become set for some reason.

You are asked to select *D* for decimal entries or *H* for hex entries. Remember to engage *Caps Lock* for hex entries. Decimal entries must be entered one at a time and ended with *999* — hex entries may be entered in blocks and ended with *S*. Do not use *Ret* (201d, C9h) in your routines, or you will pop out of the machine code with some odd results.

To start your experiments, you may want to zero all the primary registers — a routine to do this is built-in. Select *H* and then enter *Z*. After the usual pause, the screen will display all the registers as empty with the flags reset.

You now have a clean sheet to work on.

Try a few additions and subtractions to start with. Notice that *Loading* the accumulator with a negative number (ie, a number between 128 and 255 inclusive) does not affect the flags, but as soon as you carry out a mathematical operation, even adding or subtracting zero, the flags are affected.

Although the stack pointer must be returned to its original value before the end of your test routines, its behaviour can be examined by *Loading HL* with zero and adding *HL,SP*. Try the following routine after zeroing the registers:

```
210000  Ld HL,
F5      Push AF
39      Add HL,SP
F1      Pop AF
```

Now you will see that *HL* contains the value 31974, demonstrating how the stack grows downwards, like a stalactite.

You might find it useful to make a note of the binary values of the register(s) you are working on before you carry out your routine, to compare with the values after. Try the shift and rotate commands, some of them contain a surprise or two. Then see what happens when you *AND*, *OR* and *XOR* two numbers (do they have a practical value?).

I hope this program helps you to unravel Some of the hidden secrets of the Z80. ■

Scale and perspective

Michael Batty explains how to put things into perspective in the first of a three-part series

The great challenge of computer graphics is to realistically represent three-dimensional objects on a two-dimensional screen, opening the way to computer-aided design, sophisticated computer art and even computer movies.

There are two key issues. First, there is the geometry of such problems which, although tricky, is quite standard and thus easy to program. Second, there is the much more difficult question of realism, which involves removing hidden lines, colouring objects and suchlike.

Any object, for example the house we will present here, is usually represented in three-dimensions by points defined in its world co-ordinates x, y, z , which can be transformed to two-dimensional screen co-ordinates x, y . To generate perspective, the object must be seen from a viewpoint and the transformations made with respect to the distance between viewpoint, screen and the object itself. These transformations involve various movements of the object and/or co-ordinate system through

the standard operations of translation, rotation and reflection. The procedure we have programmed here can be found in most books on computer graphics, for example Myers' *Microcomputer Graphics* (Addison-Wesley, 1982).

Figure 1 shows the transformation of the three-dimensional object to two-dimensions in terms of its viewpoint and screen. The object is located in Cartesian co-ordinates x, y, z but it is easier to measure the viewpoint using polar co-ordinates. RHO is the distance from viewpoint to the origin of the object's co-ordinate system, PH the angle the viewpoint line makes with the vertical z axis (note that 90° is ground level) and TH is the angle of horizontal rotation. A fourth parameter DIS is the distance of the viewpoint from the screen. These four parameters entirely control the perspective and size of the object as it will appear on the screen.

The object is coded in terms of its point co-ordinates x, y, z but its outline is given

in terms of the planes that make up its form. Each plane consists of points arranged in the order they are linked. The object is plotted by plotting each plane and, although this involves duplication, it is the most efficient way for simple objects with a small number of planes. The program first reads in the world co-ordinates and planes from data statements, and then requests the user to supply the viewpoint parameters RHO, DIS, TH and PH . The trig functions are calculated in *Procsetup*, the transformations made in *Proctrans* and the object's planes plotted in *Procframe*.

The wire frame diagram which results, and is shown in figure 2, is plagued by optical illusions. But after a little experience with typical viewpoint parameters, the program is useful to explore the effect of scale and perspective. As the house is roughly a cube, with each side 400 units, start with the viewpoint distance as 1000 and the screen distance half this. Then explore these effects by changing all the parameters. Go near to the house and watch it explode off the screen all around you. Go inside it and go above it. There are hundreds of possibilities.

Next week, we will tackle the problem of realism by showing how you can remove hidden lines and make the house solid. ■

New from **SUNSHINE** Master your ZX Microdrive

programs, machine code and
networking by Andrew Pennell

Master your ZX Microdrive contains all the information you will ever need to use the ZX Microdrive to the full. Clearly explained, with many examples, it is equally suitable for the relative newcomer to BASIC through to the experienced machine code programmer.

Andrew Pennell has also included a full database file handling program to let you put the ZX Microdrive to practical use with your Sinclair Spectrum.

Look out for the Sunshine range in W.H. Smith's, Boots, John Menzies, other leading retail chains and through our national network of book shops and specialist stores. Dealer Enquiries: 01-437 4343

ISBN 0 946408 19 X

SPECTRUM POOLS PREDICTOR

An easy to use, but very powerful Football Pools Prediction program for the 48K Spectrum. It combines six different techniques of forecasting based on a comprehensive analysis of current form. The program can easily be 'tuned', without any reprogramming, to improve forecasts as the season progresses. Also available for the BBC micro.

Basically sound

Dave Windle explains how to generate different sound effects using Basic

One of the few ways in which the Dragon 32 lags behind some of its competitors is in its sound handling capabilities. Having just one sound channel is somewhat limiting.

However, if you have heard the sounds on, for example, Microdeal's *King or Frogger* games, you will be aware that the Dragon is capable of quite sophisticated effects. The problem is, of course, that these commercial tapes use machine code to generate the sounds needed. Now, not everybody can (or indeed, wants to) cope with machine code. So, let us examine just what the Dragon can do in the sound effects department, using only Basic.

First, we will deal with the *Sound* command. On the face of it, this command allows us to use just one sound at a time, try: *Sound 1, 10*. Not very spectacular, is it? However, it can be improved upon — try listing one.

Better, but still quite limited. Apart from lots of separate *Sound* command lines, this type of program is just about the only way to get anything like a reasonable

effect using *Sound*.

Let us go straight on to the more useful *Play* command. This command can be used to produce both music and many varied noises for games. To use *Play*, we have to construct a string of notes and instructions and then tell the computer to *Play* the string.

The two line program in listing 2 contains only the notes to be *Played*. The octave, length, tempo and volume have all been left to the default settings. The *Play* command offers more control over the notes in the string.

It is possible to *Play* notes either sharp or flat. We can also modify the four string elements mentioned earlier, using:

'+' to add one to current value
'-' to subtract one
'<' to divide by two
'>' to multiply by two

These suffixes are useful when creating sound effects for games. For an example, try listing three.

When using the *Play* command to pro-

duce tunes within your programs, the tempo parameter will usually be set at around T2 or T4. For sounds representing laser zaps or warp drives etc, you will need to raise this setting to around the T150 mark (see listing four).

If you do not read music, it can be difficult to work out the tune required. Listing five is a simple program to allow you to pick out tunes using the keyboard. No attempt has been made to set up the notes in any piano type key arrangement.

The notes are obtained by pressing the letter keys A to G. To cancel a note, just press the left arrow key and the note will then be erased from the screen. Once the tune sounds right, copy the notes from the screen for use in future programs.

The sound experiment program allows you to enter up to 10 strings of notes. You can then experiment with octaves and speeds, etc, to produce many different sounds from one set of strings.

Notes

Lines	Instructions
10 to 40	Instructions
50 to 80	String inputs
110 to 150	Set speed
160 to 210	Set volume
220 to 280	Set octave
290 to 310	PLAY string routine
320 to 370	Change or repeat option
380 to 470	Change string subroutine

WIN THE POOLS?

SPECTADRAW 2 — THE BEST SELLING POOLS PREDICTION PROGRAM FOR THE 48K ZX SPECTRUM

The program looks at the recent form of the teams playing in each week's English and Scottish football league matches and then refers to a large database to see what has happened in the past when teams with similar form met. By combining the lessons learnt from the past with the teams' current league position, the program generates a draw probability factor for each match. It can then identify the matches which are likely to yield draws and output suitable predictions. It will also output the least likely draws for the benefit of those who prefer the fixed odds lines on coupons.

Program, 8000 match database (both on high quality cassette) and instruction manual £12.95 inclusive.

NEW!!! SPECTASORT — THE PERM GENERATION PROGRAM

Spectasort takes the 14 most likely and 10 least likely draw predictions and produces ten 8 from 10 full over perms, enabling you to complete your pools coupon directly from the screen. The program will run on its own in 16K, using your own predictions, or has the unique feature of being able to merge with SPECTADRAW 2 to provide a complete Pools Prediction package!!

Spectasort program on high quality cassette £4.95 inclusive.

Write your own machine code adventures

Without any knowledge of machine code whatsoever

THE QUILL is a major new utility written in machine code which allows even the novice programmer to produce high-speed machine code adventures of superior quality to many available at the moment without any knowledge of machine code whatsoever.

Using a menu selection system you may create well over 200 locations, describe them and connect routes between them. You may then fill them with objects and problems of your choice. Having tested your adventure you may alter and experiment with any section with the greatest of ease. A part formed adventure may be saved to tape for later completion. When you have done so *THE QUILL* will allow you to produce a copy of your adventure which will run independently of the main *QUILL* editor, so that you may give copies away to your friends.

THE QUILL is provided with a detailed tutorial manual which covers every aspect of its use in writing adventures. It is impossible to describe all the features of this amazing program in such a small space so we have produced a demonstration cassette which gives further information and an example of its use.

This demo-cassette is available at £2.00. and *THE QUILL* itself at £14.95.

FOR THE 48K SPECTRUM AT £14.95

Our Software is now available from many computer shops nationwide, or direct from us by post or telephone.

SAE for full details of our range.

Dealer enquires welcome.

DORIC COMPUTER SERVICES PRESENT

THE ORACLE'S CAVE

The Oracle's Cave is an exciting adventure game containing a unique blend of
HIGH RESOLUTION ANIMATED GRAPHICS and text which has been
designed especially for the

48K SPECTRUM

NEW

Its many features include:

- Continuously displayed high resolution graphics
- Time limit of five 'days' on every adventure
- Completely new cave layout, monster position and event sequence generated for every game
- All monsters, articles and locations depicted to a level of detail that pushes SPECTRUM graphics to the limit

NEW

"THE CLOSEST YET TO A TRUE ANIMATED GRAPHIC ADVENTURE...
... EXCELLENT VALUE FOR MONEY" *Popular Computing Weekly*

Out of character

Pete Garrard creates user defined graphics characters

One of the least documented features of the 64 must be its ability to produce user-definable graphics characters.

Normally, the 64 gets its character information (ie, the shape used to make up each character) from the character generator Rom, which starts at location 53248 and continues up to 57344, in eight blocks of 512 bytes each. These are stored as shown in figure 1.

To use this information, we'll need to know how to turn character sets on and off, so let's see how that is done on the Commodore 64. The video interface chip (known as the Vic chip) which controls all of the graphics on the computer, like any other 8 bit chip, can only "see" 16K of memory at a time, so it has to be told which block of 16K you want it to look at. There are four of these 16K blocks of memory in the 64, and to swap from one to the other the following formulae are used:

POKE 56576, (PEEK (56576) OR 3: REM SETTING BITS 0 AND 1 OF PORT A OF 6526 CHIPS2 TO ZERO

POKE 56576, (PEEK (56576) AND 252) OR A: REM SWOP FOM BLOCK TO BLOCK

If $A = 0$, we're looking at locations \$C000-\$FFFF (starting at 49152), if $A = 1$, we're looking at locations \$8000-\$BFFF (starting at 32768) if $A = 2$, we're looking at locations \$4000-\$7FFF (starting at 16384) and if $A = 3$, we're looking at locations \$0000-\$3FFF (starting at 0). On power up, we're always looking at locations \$0000 to \$3FFF, or block 0.

To swop character sets in and out, a few more things have to be done. One of the peculiarities of the 64 is that the locations occupied by the character Rom are the same as those occupied by the Vic chip control registers. There's nothing to worry about, however, because of the block switching procedure they're never in the same place at the same time.

To change the location of character memory, the following syntax is used:

POKE 53272, (PEEK (53272) AND 240) OR A

where the value of A obviously determines where character memory will now sit. A value of 0 starts it at zero, 2 at 2048 and, going up in blocks of 2048 bytes, A successively takes the values 4, 6, 8, 10, 12 and 14, whereupon character memory will start at \$3800, or decimal 14336.

When swopping character sets around, we need to block off all interrupts to the computer. This is done by: *Poke 56333, 127.*

Since the character Rom is sandwiched between the Input/Output Rom on top of it and user Ram underneath it, we must also switch out the I/O Rom. This is done by: *Poke 1, 51.*

Now we can read our character information from Rom and store it in Ram. The following line copies 128 characters from Rom (in fact, the first 128 characters, from

location 53248 upwards) and puts them into Ram:

FOR X = 0 TO 1023: POKE 53248 + X, PEEK (53248 + X): NEXT

Now, this means that the first 128 characters of character Rom are sitting in locations 53258 to 54271 (1024 bytes further on, as each character information occupies 8 bytes, and we've just moved 128 of them), so locations 54272 and upwards are now available for our own use. Thus, we now need to know how to define our own characters. So, let's see how a typical character is made up, taking the letter *A* as an example.

Every character on the 64 is designed as an 8 by 8 pixel grid, like this:

```
00011000
00111100
01100110
01111110
01100110
01100110
01100110
01100110
00000000
```

where the zeros tell the computer which pixels are to be turned off, while the ones signify which pixels are to be turned on. Thus, the letter *A* is built up.

To define our own character, it too must be created on an 8 by 8 grid. We'll define a little alien:

```
00011000
00111100
01011010
11111111
01100110
01100110
11000011
11000011
```

We need to tell the computer which pixels to turn on, and which to turn off. This is achieved by assigning a number to each column of our grid, like this:

```
ABCDEFGH
00011000
00111100
01011010
11111111
```

```
01100110
01100110
11000011
11000011
```

where $A = 128$, $B = 64$, $C = 32$, $D = 16$, $E = 8$, $F = 4$, $G = 2$ and $H = 1$.

Now, we look at each row of the grid and, wherever we see a number 1, we add the appropriate value for that column. Thus, our little alien now becomes a series of numbers for each row:

24, 60, 90, 255, 102, 102, 195, 195.

Row 1, for instance, is made up of $0 + 0 + 0 = 16$ (D is turned on) $+ 8$ (E is turned on) $+ 0 + 0 + 0$, equals 24, and so on.

Going back to our earlier program, we can now add the following lines to read the data for our new character, and put it immediately after the first 128 characters read from Rom:

```
FOR X = 0 TO 7
READ A: POKE 54272 + X, A
NEXT X
DATA 24, 60, 90, 255, 102, 102, 195, 195
```

Obviously, you'd be making up more than one new character, and so the range of the *For ... Next* loop would be increased, and the data statements would be extended. All we have to do now is turn I/O back on again, switch interrupts back on again, and tell the Vic chip where its video memory has gone. This is done with:

```
POKE 1, 55: POKE 56333, 129
POKE 648, 196: POKE 56576, 4: POKE 53272, 21
```

So, video Ram now starts at 50176, character Rom (or more accurately Ram) now starts at 53248, but colour memory stays where it is.

There are a couple of side effects to doing all of this: sprites now become 24×24 pixel characters, their data pointers now go from locations 51192 to 51199, and to find where you must now store your sprite data, use the formula $(49012 + (74 * A))$, where A is the data block you want to point the sprite at. Remember also that sprites are now 72 bytes, not the usual 63.

By using this formulae you'll be able to build up a whole series of character fonts, perhaps stored as a file on disc and called in when needed. ■

Block	Address		Contents
	Decimal	Hex

1	55808	DA00-DBFF	Upper Case & Graphics
1	56320	DC00-DDFF	Reverse Case Lower Case Characters
1	56832	DE00-DFFF	Reversed Upper Case & Graphics Characters.

CHOOSING A HOME MICRO

WARNING

Choosing a home micro can be a daunting task to the newcomer, and with an ever increasing number of micros emerging on the market, even up-grading, say, from a ZX81 can be a risky and expensive exercise if the wrong decision is made. It is important to look at the real facts and specifications, and check exactly what you get for your money before choosing your micro-computer system.

THE PITFALLS

"DON'T LET THE ADD ONS ADD UP"

A number of large companies are offering packages that seem to be good value and low cost. These offers usually have a hidden sting inasmuch as the essential accessories such as connection leads, peripherals and software often carry very high cost premiums. e.g. software for low cost hardware usually costs between £29 and £49 for a ROM cartridge!!

CHECK THE QUALITY OF THE PRODUCT.

Raw materials are now an area where corners can be cut, and shoddy workmanship during 'building' can effect the 'up-time' of your unit. Areas to watch out for are unreliable edge connectors, corrosion and poor quality P.C.B.s. Low quality components and bad design will seriously effect the reliability of the end product, and can lead to false economy.

DON'T BUY A GAMES MACHINE

Unless you want just games and nothing else! With a games computer you are limited. Some computers, however, have the advantage of both games facility plus the whole world of computing to explore, as your interest and skills develop. A real computer system will allow you to expand your knowledge of the Hi-Technology world, and help earn its keep with its added uses in the field of education, communication and home business use.

SOFTWARE

Make sure the system you choose has a growing library of support software, to enable you to realize the full potential of your machine.

KEY POINTS TO LOOK FOR

● High Resolution Colour

In general most home computers have a poor graphics resolution (or detail). Check on the vertical and horizontal resolution in graphic mode and multiply the two numbers together. If the result is less than 35,000, then the graphics can hardly be considered high resolution. Without high resolution graphics displays such as those used in games tend to be "Chunky" in appearance.

● High Quality Sound

Some computers claim to provide a sound channel when in reality all that can be found inside the computer is a small buzzer controlled by electronic pulses. At the very least a sound facility should provide more than one channel and a raise channel as well (for gun shot effects in games for example). The best systems also provide envelope control of the sound channels to produce very sophisticated effects; very important for generating music. Also look for the ability to connect to external amplifiers.

● Keyboard

For accurate entry of programs and data into a computer it is important that the keyboard has a good tactile feel in operation. Coupled with acoustic feedback the user is fully aware when the computer has accepted his/her actions. Also of importance in a keyboard is layout. A standard computer keyboard layout will familiarise the user with the vast majority of computers used in the world of business and professional applications; very important if the purpose of purchasing a computer is educational.

● RAM

One of the most important features of a computer is the amount of RAM, or memory, included. In general the more powerful and exciting a computer program is the more RAM it requires. But take care, all computers are advertised quoting the total RAM used in the system. Computers use up a great deal of their own RAM for storing essential data and particularly in supporting the graphics display and the CPU. If it is less than 32K think again, is it enough?

● Computer Language

It is too difficult to program a computer in its own binary language so high level languages are used, the most popular being BASIC. However, there are a number of BASICs, some being very different from the rest. A de facto standard in the computer industry is Microsoft BASIC. Learn this one and you will be able to program in the majority of computer BASICs; such an important point if a home computer is to be used to educate your children to face the technology of the future.

● Expansion

As your interest and knowledge of computing grows, you will need a

Choosing the right system carefully will save you from throwing your money away. Check full specification, plus peripherals and software prices, before you buy. Preferably choose a Real computer system that can expand to meet your needs.

computer system that will grow with you; able to accommodate Printers, Disk-drives, Joysticks, Communications Modem, and Colour Monitor, as well as produce HI-FI sound effects.

● Software

The computer you choose should have a growing selection of utility

software to make the most of its capability.

Remember, computing is here to stay. You can't learn to compute on a toy, or a device which does not behave like a real computer. In short, look out for a computer which offers all the points above, and you will be sure of getting the best value for money.

To find out which company offers you the right choice, with:-

- Good value, high specification, quality micros.
- A quality, 4 colour, plain paper printer/plotter.
- Communications Modem.
- Micro Disk Drives.
- Comprehensive and growing range of software

TURNOVER... →

ORIC-1

The Growing System

ORIC 3" MICRO FLOPPY DISK DRIVE

Coming soon the incredible new 3" Oric Micro Drives. Small size. Compact. High precision disks with storage capabilities from 100K Bytes to in excess of 1 Megabyte unformatted. With their own built-in power supply, these easy to use units will add big system capability to your home micro.

ORIC MCP 40 COLOUR PRINTER/PLOTTER

The Oric Colour Printer is quality engineered to provide 4 colour hard copy on plain paper, with superb graphics and text capability, printing either 40 columns or 80 columns. It prints in red, green, black and blue, onto a 4½" width standard paper roll. With a print speed of 12 characters a second, the MCP 40 comes with its own power supply and all necessary leads to connect straight into your Oric or to any standard Centronics interface.

This superb printer represents excellent value at just
£169.95 including VAT.

The right choice for real computing

ORIC-1

Before making your final choice, check any other home micro in the same price bracket, against the incredible specification of the ORIC-1.

● Quality of build and materials		● Real computer keyboard layout and moving keys	
● Superb styling / Full colour display		● High Resolution colour graphics 240 x 200 pixels	
● Choice of 16K or 48K RAM		● Real computer language programming – Basic / Forth	
● Latest design technology and circuitry		● Teletext/Viewdata compatible graphics (28 rows x 40 characters)	
● Real sound – 8 octaves plus Hi-Fi output		● Cassette Port & R.G.B. output.	
● Centronics printer interface		● Fully supported and growing software library	
● Colour printer / Disk Drives		● A fully expandable system for home, education & small business use	
● Communications Modem		● Full range of peripherals to support your system...	

ORIC-1 Setting today's standard in Quality and Price.

ORIC-1 48K £139.95 inc. VAT ORIC-1 16K £99.95 inc. VAT

All ORIC computers purchased before 31st December 1983 come with a £40 voucher off the M.R.P. of the MCP 40 Colour Printer.

**MCP 40 COLOUR PRINTER £169.95.
OFFER PRICE £129.95**

TANSOFT ORIC Software

The fast growing success of ORIC-1 means that an incredible number of software titles are becoming available for your Oric. With many well known titles from independent software houses, plus exclusive ORIC SOFTWARE from TANSOFT, you can now drive your Oric towards its full potential.

Below is a small selection from Tansoft's range, all of which offer superb value.

BUSINESS

ORIC BASE, ORIC CALC, AUTHOR.

MACHINE LANGUAGES

FORTH, ORIC MON.

COMPUTER GAMES

ZODIAC, HOUSE OF DEATH, ORIC MUNCH, SUPER BREAKOUT, ULTIMA ZONE, DEFENCE FORCE.

SOFTWARE FOR SPECTRUM AND ZX81

OUR POLICY

We aim to create programs which you will keep on using until your computer wears out. You won't find our programs in the top ten and you will look in vain for colour adverts and fancy packaging. Nevertheless we have built up a solid following of discerning users in all parts of the world. Read the reviews of our programs if you can find them. We have been consistently praised for quality, originality and value for money.

WHAT DO YOU GET?

The bulk of our cassettes are now made by the factory which produced the Horizons tape. Programs are recorded twice and carry on the reverse side an audio narrative to supplement the operating instructions. Where appropriate, cassettes are accompanied by a comprehensive and clearly written instruction manual.

48K SPECTRUM

"Day of the Match" £5.00

Fascinating and realistic simulation of an entire football season. Name your own teams if you wish (English league provided on cassette). Rate each team from one to nine in various success categories such as attack, defence, manager, etc. Watch the season unfold. Includes knock-out cup option.

"Ball by Ball" £5.00

Simulates a test match series or one day international series. Set up your own teams and pool of players (England v Australia provided). Rate each player's capabilities as batsman and bowler on a one to nine scale for qualities such as talent, effort, etc. Pick your teams and play the match. Electronic scoreboard shows progress of a match. Full supporting score card and series averages.

"Superplan Generator" £12.00

Spreadsheet type program with variable column width and variable number of columns. Lets you sacrifice columns you don't need to get more lines.

"Superplan Pack 1". Business Applications £7.00

Ready made applications programs for sales day book, purchase day book, cash book and petty cash book.

"Superplan Pack 2". Home computing £7.00

Ready made applications programs for home budgeting, nutrition tables, car running costs and bank statements.

"Superview" £5.00

Simple but effective information display. Up to 42 pages of text and low-res graphics. Access pages on demand or run in perpetual 'slide-show' mode. Full facilities to create your own pages and build up an information library on cassette.

16K SPECTRUM

"Superdraw" £5.00

Create full colour high-res pictures and store them on cassette for use as titles or background screens in other programs. Or just have fun doodling and build up a cassette library of your creations. Slide show option allows you to review pictures stored on cassette.

16K ZX81

Here is a selection of titles still available for ZX81. Send sae for illustrated catalogue. These are the ZX81 equivalents of the Spectrum programs described above. Although similar in concept the specifications fall short of the descriptions given for the Spectrum.

"FOOTBALL-LEAGUE" Forerunner of "Day of the Match" £4.00

"TEST-MATCH" Forerunner of "Ball by Ball" £4.00

"VIDEO-PLAN" Forerunner of "Superplan" £7.00

"VIDEO-AD" Forerunner of "Superview" £7.00

"VIDEO-SKETCH" Forerunner of "Superdraw" £7.00

Many independent computer shops now stock our products but we continue to supply by mail order on an off-the-shelf, immediate delivery basis. Prices include VAT, post and packing in UK. Add a bit for postage if you live in Outer Mongolia. (Note: "Day of the Match" not available until late October 1983.)

Video Software Ltd, Stone Lane
 Kinver, Stourbridge, West Midlands
 Telephone: 0384 872462

Murder at the Manor

Death comes to a quiet country village when the Lord of the Manor is savagely murdered.

The police are baffled with no obvious clues to help them.

Your skills as an ace investigator are required to identify and apprehend the murderer. This will involve searching for clues (which could be dangerous requiring ingenious deductions), examining the scene of the crime and asking questions of the right people.

What is the mystery of the Gravediggers Hut?

What secret does the safe hold?

What lurks at the bottom of the brook?

These may be some of the questions you will ask yourself during your investigation into the murder at the manor.

The game is based on a fixed map, comprising the Manor House, the Garden, the Town, the Graveyard and many other fully described locations, inhabited by a variety of individual characters whom you are likely to meet.

It is up to you to solve the murder, the locals may know the answer — but will they tell YOU!

This original adventure fills your 48K Spectrum with over 120 locations, all of which are depicted in full colour machine-coded graphics.

Add sound effects, a full score and save game facility plus a comprehensive and easy to use command analyser (incorporating abbreviations and multi-command lines) and you are sure of many exciting and frustrating hours.

WARNING — this is a 4D adventure where night brings added difficulties.

Cassette and instruction Booklet
costs £6.95 inc.
GEMTIME, 16 Ben Ledi Road, Kirkcaldy, Fife.

PHEENIX

"Superb presentation, graphics and sound. Highly recommended" (Home Comp Weekly)
"The best Spectrum 'Phoenix' yet!" (Software Supermarket)

(Screen 5)

You are in command of the star-destroyer Phoenix. Swarms of robot scout birds attack you. Beautiful eggs magically appear, then hatch into deadly Phoenix war birds. Can you survive to face the heavily guarded flagship?

- * 5 screens * 5 skill levels * demonstration mode
- * full sound effects * music * flapping birds
- * Kempston & AGF joystick compatible * 100% m/c

ZX MICROFAIR

More Sinclair Computer
games, goodies and presents
than in Santa's grotto.

GREAT TWO DAY SHOW AT ALLY PALLY DECEMBER 3rd & 4th

There's more to see, more to play with, more to experiment with and more that's NEW for Sinclair Computers at the great TWO DAY ZX MICROFAIR AT ALLY PALLY!

Come along and see for yourself.

It's the BIG SHOW for ZX enthusiasts and the ideal opportunity to pick up that last-minute Christmas present!

So, whether you're looking for a Sinclair Computer, hardware, software, peripherals, books or anything that's new...

...there's everything from GAMES to GIZMOS at the BIG ZX MICROFAIR!

More than there is in Santa's Grotto!

SATURDAY 3rd DECEMBER and SUNDAY 4th DECEMBER 1983

ALEXANDRA PAVILION, ALEXANDRA PALACE, WOOD GREEN, LONDON N22.

Open: Saturday 10am-6pm, Sunday 10.30am-4.30pm.

Advance Tickets from: Mike Johnston, 71 Park Lane, Tottenham, London N17 0HG.

Prices: Adults £1 Kids (under 14) 50p. Parties of 10 or more at 10% discount!

Please make cheques payable to ZX MICROFAIR and enclose S.A.E.

CUT OUT AND KEEP

By British Rail
From London (Kings Cross or Moorgate) — about every 10 minutes to Alexandra Palace station — free shuttle bus or short walk from there!

By Road
Follow signs from the A1 (links with M1 and North Circular). Plenty of parking space available! Variety of routes from Central London.

By London Transport
Underground: Victoria Line from Victoria (also Oxford Circus, Kings Cross/St Pancras) to Highbury and Islington — change (cross) platform to B&B Suburban Service to Alexandra Palace — free shuttle bus or 5 minute walk from there!

Alternative: Piccadilly Line (from Heathrow etc) to Finsbury Park or Wood Green — Link with B&B bus service to the fair!

From any part of the U.K. enquire from Kings Cross Travel Centre, London N2 1AP (phone 01 278 2477) about special day trips to the ZX MICROFAIR!

9th
ZX MICROFAIR
ALEXANDRA PALACE
DECEMBER 3rd & 4th 1983

EXHIBITORS! Call Mike Johnston now on 01-801 9172 for details of space at this and future shows!

OPEN FORUM

Open Forum is for you to publish your programs and ideas. Take care that the listings you send in are all bug-free. Your documentation should start with a general description of the program and what it does and then give some detail of how the program is constructed. We will pay the *Program of the Week* double our new fee of £6 for each program published.

Copyline

on ZX81

One of the biggest problems with the ZX81 and printer is the lack of a command to print selected lines from the screen. *Copy* prints out the whole screen — this 39 byte

machine code routine solves this problem by letting you print any number of screen lines you wish.

First type in the Hex loader making sure that the *Rem* statement has at least 39 full stops. Then run this program entering the Hex numbers on the left hand side of the other printout when prompted. To make it

clear, it should start ED4B 7B40 7980 . . . When the numbers have been entered all the lines except 1 should appear deleted.

Using the routine

- 1 *Poke* 16507 with the number of the first line to be printed (remember the first screen line is 0)
- 2 *Poke* 16508 with the number of lines to be printed
- 3 *Let* ZZZ = *Usr* 16514

The program changes the D register which usually holds 22 for the *Copy* command to (Peak 16508) and HL to (Peek 16396 + 256*Peek16397 + 1 + (33*Peek 16507)). It then jumps into the Rom at the next address of the *Copy* routine.

Words

on Ace

This is a listing of *Forth* words. These

words will fit on any Jupiter Ace regardless of memory and are intended to provide missing or helpful features for the compe-

tent programmer. Simply type them in as they are printed and they will be ready for use.

EXPECT

This requires two numbers on the stack, on top a delimiter and second from top an address. What it does is give the user a chance to type in a string and then it will put the first character to the specified address, the second to the address + 1 and so on. This is handy as it allows several messages to be typed in and stored in memory leaving the *Pad* free for more immediate things.

```
:EXPECT
  QUERY WORD C@ 0
DO
  9986 I+ C@ OVER
  I+ C!
  LOOP
  DROP
  :
```

MEM

This simply tells the user how many spare bytes are left for *Forth* programming.

```
:MEM
  15384 @ HERE — CR.
  "Bytes left."
  CR
  :
```

SCREEN-

This needs two numbers on the stack, a line number second from top and on top a column number. It will leave on top of the stack the character code of the character at those screen coordinates and also set the print position to those coordinates as well.

```
:SCREEN$
  AT 15388 @ C@
  :
```

BASE

This will tell the user the present number base in decimal, eg, if the computer is working in *Hex* ?base will display Base 16. It does not alter the number *Base*.

```
:?BASE
  BASE C@ DUP DECIMAL
  CR. "Base". CR
  BASE C!
  :
```

NORMAL

This word will reset various system variables, they are;
Base set to 10 (ie, decimal).
Visible mode restored.
Slow mode restored.
Both stacks are cleared.
The screen is cleared.

```
:NORMAL
  CLS DECIMAL VIS
  SLOW QUIT
  :
```

Renumber

on Oric

This program should be useful to all Oric owners as there is no renumber facility within the Oric basic. The program has been written in basic and rennumbers pro-

gram lines. (Gosub's, Goto's etc. are not catered for in this version).

The program also helps to explain how the Oric stores basic programs in memory.

Variables

DEEK (#9A) = start of basic program.
DEEK (#9C) = end of basic program = E.

A = address of basic program line = DEEK (A)
N = line number.
S (initially) = start line number from.
I = increment.

To use the program simply enter Goto 63900. An increment range of 1 to 100 has been permitted but this is easily changed in line 63925.

```
63900 REM*RENUMBER by G. M. Jackson
        copyright 1983
63905 PRINT CHR$(12); SPC (10) "RENUM-
        BER": PRINT
63910 INPUT "Commence line numbers from"; S
63915 IF S<1 OR S>63899 THEN GOTO 63910
63920 INPUT "Increment by"; I
63925 IF I<1 OR I>100 THEN GOTO 63920
63930 A=DEEK (#9A);E=DEEK (#9C)
63935 N=DEEK(A+2)
63940 IN N>=63900 OR A>E THEN PRINT
        "RENUMBER COMPLETED":END
63945 DOKEA+2,S:S=S+I:A=DEEK(A)
63950 GOTO 63935
```

by G Jackson

Speed Run

on Vic20

Drive your rally car across rocky desert terrain to the next checkpoint flag, located

somewhere along the top of the screen. Each flag reached gives a score and another 10 rocks to avoid. Remember that you only have 15 minutes of fuel so don't hesitate.

Program notes

1-40 Initialise variables and graphics
45-55 Set up screen
80-110 Test key pressed
200-400 Move car
2000-2100 Boom!
5000-5100 Flag reached in one piece
10000-end Print time

```

Character Definer

on Dragon

In this program you are able to define an image within an 8*8 grid which is then

stored in a *Get* array. When using the program you have to enter eight '0's or eight '1's, eight times. If you enter a '0' then the pixel at that point on the 8*8 grid will not be *Preset*. However, if you enter a '1' then it will be *Preset*. The grid can be

altered to a larger one by changing the number '8's in lines 70, 80, 90, 100, 160, 200, 220.

This program is ideal as a header to graphics programs where the '0's and '1' can be stored in data statements.

ADS. THE ULTIMATE IN PERIPHERALS FOR THE SPECTRUM, JUPITER ACE & BBC MICROCOMPUTERS

"Highest quality peripherals at the lowest possible prices" — that's the philosophy at Advanced Digital Systems. Our team of highly experienced designers use the very latest techniques to produce adaptable home computer peripherals — at a price you can afford.

- Boards are designed using CAD/CAM, giving a neat optimum layout.
- Gold plated connectors are used, wherever possible, to ensure good electrical contact.
- All products carry a 12 month guarantee.
- All units are "Plug in and go".

PRINTER INTERFACE 1

Centronics Interface for the Sinclair Spectrum. £34.50 inc. VAT. Comes complete with approx 1 metre of cable, centronics plug and software.

- Software recognises LLIST and LPRINT enabling Print-outs direct from Basic. Also adaptable COPY routine for graphics printers.
- Completely adaptable to 3 different Micros the Spectrum, ZX81 (write for details) and Jupiter Ace. (see below).
- Units are housed in custom designed black ABS Cases.

PRINTER INTERFACE 2

Centronics Interface for Jupiter Ace. £39.95 including VAT and Software. Same unit as the Spectrum Interface but with adapter card.

Advanced Digital Systems Ltd.

Manufacturers and Designers of Microcomputer Peripherals.
9 Bonchurch Road, PORTSMOUTH, Hampshire PO4 8RY. Telephone: (0705) 823825.

- Adapter Card has two edge connector outlets, one for ADS unit and the other a duplicate ACE Outlet for RAM PACKS etc.

PERIPHERAL INTERFACE 3 — ZX ACE Package
Using the adapter card and the Software supplied, the Sinclair ZX Printer can be connected to the Jupiter Ace. Special Introductory Offer £9.95 inc VAT.

- Two versions of the driver software included:
— One will run on unexpanded ACE, but will not deal with graphics or user defined graphics.
— The other will run on expanded ACE and deal with all characters.

PERIPHERAL INTERFACE 4

Adapter for BBC Model B

Ring or write for details.

This gives an amazingly cheap entry into printing on the BBC model B by allowing you to use the ZX Printer—ideal for listings.

PERIPHERAL INTERFACE 5

See our future advertisements for our latest items to be released.

Please send me the items as ticked.
I enclose cheque/order for Total
(Include £1.00 for post and packaging).

GAMES AND PUZZLES

16K SINCLAIR ZX SPECTRUM

The traditional game with superb screen presentation. Score points by making the two ends add to a multiple of five or three. The first one to reach 72 points wins.

£4.95

The cassette of the book. Contains six games (including Castle Walls, Great Fire of London, Reversi) machine code assembler, disassembler.

£5.95

Book available separately £6.50

It is nearly dawn, you are poaching rabbits in a field of carrots. See how many you can bag undetected by the game keeper. Highly original arcade style game.

£4.95

The computer breaks and shuffles a two by two coloured square, whilst you watch the moves it makes. You must then unscramble it to re-assemble the original squares. Machine coded.

£4.95

Send SAE for full list.

PHIPPS ASSOCIATES

Dept C FREEPOST EM463 (No stamp)
172 Kingston Road, Ewell, Surrey KT19 0BR

Telephone 01-393 0283. 24 Hour answering.

Access and Visa cards welcome

Prices include postage (outside Europe add £1.00 per item).

OPEN FORUM

Mine Blaster

on Spectrum

The game involves the players ship blasting as many mines in the time limit without hitting one and losing a life.

The game uses two machine code

routines data for which is held in 710 and 720. One routine reverses the screen (for explosions) and the other scrolls the top two-thirds of the screen from left to right. The Print *Usr* statements call the machine code routines (lines 90,340) instead of Randomise as this can make the *RND* function not very random.

Line 10 checks to see if machine code is poked in, if so it goes straight into the game.

Microradio

GW6JJN

The naked ear

While tuning the radio receiver I mentioned last week, you will come across RTTY. This means Radio Teletype and most modern communication systems use it. To most ears it sounds rather like the sound your cassette software tapes make, if you care to listen to them.

Unlike morse, this code cannot be understood by the naked ear, so to speak. Before the advent of the home computer, you would have had to spend a great deal of money on big teletype machines with a paper printout. Now, with

the micro, even a ZX81, you can receive and transmit RTTY.

The major world news services use RTTY and even Tass, the Russian news service can be decoded — of course, it helps if you speak Russian. Still, most of the others are in English. Again weather stations, radio amateurs, satellites and a host of other organisations use RTTY so the magic is all worth the effort.

RTTY is in a code called the 'Baudot' code and is transmitted using frequency shift keying (FSK). This consists of sending a signal, which changes between two frequencies known as the mark and space frequencies. These marks and spaces indicate the start of each character, the end and the various bits in the middle which comprise the message.

As RTTY is a code, a short program is required to decode

it. Then an interface is necessary to change, with great accuracy, the micro's parallel information to serial information. This interface will set the baud rate, or the number of characters per second, and consists of a clever chip called a UART (Universal Asynchronous Receive Transmitter). Also required is a tone unit, which converts the micro's voltages to the correct tones, rather like a modem.

Unless you are extremely well versed in electronics, then it is probably preferable to buy the complete package for your micro, especially since prices for the complete unit for the ZX81 and Spectrum start at around £35. I hope to be reviewing a unit in this column soon.

To be equipped to send, or even just receive, RTTY will open up a new world. There is a great deal of RTTY on the short wave as well as higher

frequencies, everything from snowstorms on the icepack to the price of fish in Hong Kong.

Next week, up into space to talk about satellites. Keep the input coming. All these subjects will be dealt with in this column.

Ray Berry GW6JJN

● Dr Owen Garriott, one of the crew of the latest US space shuttle Columbia is an amateur radio enthusiast.

He has been given permission to take his equipment with him on the mission and broadcast for an hour a day.

The Columbia will be launched on October 28 and, during each hour's transmission, his broadcasts will be in range of British radio amateur radio enthusiasts for eight minutes.

More information from John Nelson at the Radio Society of Great Britain.

GIANT'S CASTLE £5.95

by MIKE MEINECK

A Junior Graphics Adventure

Explore the castle, fight the wicked Guardians and rescue the fair
Damsel to gain a hero's reward!
Suitable for ages 7 to 11 (younger if assisted). Editing instructions
supplied (to customise general knowledge questioning).

DRAGON STICKS

The ultimate Dragon/CoCo ana-
logue sticks, with guaranteed fire
button. £19.95 per pair, post free.

TEMPLE OF ZOREN £7.95

by MIKE MEINECK

An Intermediate Level S.F. Adventure

Previous agents didn't make it, but Terran Security rely on you to
survive this espionage mission long enough to bring back the
Golden Orb, a map of Zoren and a sample of the latest Zoren
Laser Gun. Out of fuel on landing, you'll also have to solve the
problem of getting off the planet!

MATHS-TREK £5.95

by ANDREW JONES

An Educational Odyssey

To bring the "Enterprise" back to base, through the Black Holes,
Asteroids and Klingon Gunships, you'll have to prove that a Space
Captain can handle his maths.
Fifty skill levels and six branches of maths selectable. Suitable for
ages 6 to 16.

Dragon Dungeon

QUALITY SOFTWARE FOR THE DRAGON 32

BUGGED! £5.95

By ANDREW JEAUVONS

The Tactical Arcade Game

Wave after wave of killer BUGS,
deadly BUG NESTS, crafty and
homicidal INDY-BUGS and MASS
MUTATION from Screen 21 on-
wards! Survival impossible, but can
you make the BUG-BASHER HALL
OF FAME? The only way to destroy
the little blighters is to roll the
EGGS on to them and squash 'em!
On-screen Scoring, Wave Data and
Lives Left. BE WARNED! Intelligent
manoeuvring and lightning tactical
decisions count for more in this
game than pure arcade reflexes.

TREASURE TOMBE £7.95

By MIKE MEINECK

A Real-Time Graphics Adventure

Don your chain-mail and crawl down into Merlin's 90-chamber
tomb complex to search for Arthur's treasure. Wizards, Warlocks,
Goblins, Vampires and a host of other dungeon-spawn await!

OSCAR THE OWL'S MATHS TEST £4.95

by R. WESTWOOD

Maths testing for Primary School Children. Complete the sum on
Oscar's blackboard before Lennie the Looper Caterpillar reaches
his mushroom. Selectable type of sum, difficulty and timing.

THE CRYSTAL CHALICE £7.95

By MIKE MEINECK

An Advanced Level Swords and Sorcery Adventure

The Klarz smashed the Chalice and scattered the shards to the four
corners of the doomed Kingdom of Quorum. Darkness and evil
now hold sway and a thorn-spiked Tanglewood has overgrown the
Meadowplain.

Your Quest will take you from the Black Lagoon, through the
dungeons of the Klarz itself to the rambling Farlands. Brute
strength and cunning will both be required.
(Clue sheet available on request.)

MIDAS MAZE £5.95

by MIKE MEINECK

A Movement Game for the Younger Player

All that glitters is not gold! Don't fall into the Devil's Kitchen where
escape demands the eating of Power Pies and keep your fingers
crossed that the Good Fairy helps you.

*CASH-FLOW £8.75

by A. S. CLARK

Money Management for Home and Small Businesses.

Cave Crawler

Back to the mainstream for the Adventure review for this week, which is *Quest*, the new tape from Hewson Consultants who have been rather busy releasing new stuff.

Before anything starts, the program asks what character you would like to play. What an agonising choice! You'll find all the old favourites on the menu — Wizard, Cleric, Rogue, Fighter or Simpleton.

To pick the last one is not as daft as it might appear — each character has its own blend of the usual D & D-type attributes (Strength, Dexterity, Wisdom and so on), and the Simpleton has a large helping of Charisma, as well as being quite strong. Of course, it's not bad to be a Fighter, either, with his 50 points of Strength, although he is not very charming (only 10 points of Charisma).

My personal favourite, however, is the Wizard, who has a roughly average point score in each attribute, but can, of course, use all the spells available. These number 12 in all, and range from Magicglow, which acts a lamp for the blink of an eye, through Longlight and Firebolt to Superstrength and Zaphim.

All these must be bought, and each character may only use a certain number, except the wizard, who, as I said, may use any spell.

Characters chosen, the Quest begins. This is another split-screen program (they're really popular nowadays, aren't they?), with an unusual text input. This is, confusingly, at the top of the screen, and is limited to a 32-character line.

The Adventure follows the usual format — I've lost count of the number of times I got lost in the blasted wood — and the program recognises all the usual words, along with a few peculiar to this Adventure, like *Buy* and *Cast*.

Help elicits, not the usual cryptic clue, but information about the monster or weapon specified. To get a clue, the player has to type *Hint*.

Some 30 commands are given in the documentation (the cassette inlay, that is!), but you will have to find others out for yourself.

Not only do the Spells follow D & D practice, but the combat procedure is also Fantasy Role-Playing in basis. The computer calculates and compares "hits" for each side with dice throws for each opponent.

Thus the result of, say, three dice throws (this depends on the monster) is added to the Hit Points of the Monster, and this figure compared with the result of a similar computation for the Player. The winner is the one with the higher result. Before fighting, the player can find out the opponent's Hit Points and dice throws, by typing *Help*.

Should the player lose this confrontation, there is a resurrection procedure, but this doesn't always work, and if it does, the player may well find things have changed somewhat!

There is a maximum of 600 points to be scored — in the few days I've had the tape, I've managed to achieve a rating of *Cave Crawler*. At least the program doesn't gloat when assessing your performance. But I don't know what other ratings there are yet!

This is, of course, one of the time-honoured ways to ensure that the player returns again and again to the game, but unfortunately, there is a major hurdle in the way of doing so — once the present game is finished, the program just hangs up! No warning, no explanation, just a screen that sits there looking at the player, defying all attempts at restarting! So, it's back to *Loading* the thing again; and that seems to take forever!

Surely Hewson could have arranged a Y/N routine to enable the player to try again?

Apart from this flaw, and the weird text input, I liked the program, and I'm looking forward to getting off the Cave floor!

Quest, which just about fills the 48K of the Spectrum, comes closer to combining the thrills of D & D with the intellectual problems of Adventure than any other Adventure I can think of, and I can recommend it without hesitation.

Back to the Spectrum to finish. Tim, Fretz and Daz (are you sure?) are stuck at the door to the computer room — I would think that you should do something nasty to the door, haven't you got a gun yet?

Artic themselves have Help Sheets for their Adventures, and it may be worth writing to them. On this subject, however, several people have returned tapes that they believe to be faulty to Artic who have advised them to contact Sinclair.

Now that Sinclair have signed an exclusive deal with Artic, all correspondence about faulty tapes should be addressed to them.

Tim, Fretz and Daz, though, have completed *Inca Curse* with a score of 4250, and they would like to know if this is a record?

Sorry, chaps, but the same day brought a letter from Andrew Sweetley and his friend, who let me know that they had completed *Inca Curse* with — you guessed it! — 4250 points!

Finally, another update to the Hobbit Hall Of Fame:

1. Edgar Whitley who completed the Adventure in 9½ minutes — is this a record, he would like to know?
2. Kevin Cowley whose brother bet him a Spectrum game that Kevin's name wouldn't be mentioned! Sorry, Kevin's brother, but you owe your brother *Manic Miner* at the very least!
3. Paul Millar.
4. Bilbo (Chris) and Elric (Neil), who are now off to beans and Hula Hoops!
5. Alistair King (who is 10 and did it in two games).
6. Gary Collier, who completed the game in five days.
7. Miss Nicky Evers.

Next week, I will be having a look at the Scott Adams empire.

This series of articles is designed for novice and experienced Adventurers alike. Each week Tony Bridge will be looking at different Adventures and advising you on some of the problems and pitfalls you can expect to encounter. So, if you have an Adventure you want reviewed, or if you are stuck in an Adventure and cannot progress any further, write to: Tony Bridge, Adventure Corner, *Popular Computing Weekly*, 12-13 Little Newport Street, London WC2R 3LD.

INTERRUPT SCAN

Mr T Thomas of Newstead Road, Weymouth, Dorset, writes:

Q Could you please tell me what an Interrupt does?

A An interrupt does exactly what its name suggests, it interrupts the operation of the processor regularly throughout the time that a computer is powered up. This is usually to scan the keyboard to see if a key has been pressed, or to refresh the Ram so that its contents do not decay. For example, the Spectrum's Z80a interrupts every fiftieth of a second to refresh the Ram. In the more sophisticated games programs, interrupts are often used to provide a quick keyboard response.

MICRONET 800

Mr T Hennessy of Sidcup Road, Mottingham, London SE9, writes:

Q I have been abroad for almost all the last nine months, and my Issue 1 48K Spectrum is almost unused. I came back a week or so before the last Microfair, which I went to, to try and catch up on what I had missed. Among a large number of things that caught my eye (and in some cases my wallet) was a mention of Micronet 800. Unfortunately I was not able to follow it up. I have seen it mentioned in a couple of computer magazines, once in connection with the Spectrum. Can you tell me what it is.

A Micronet 800 is a home computer network system, that has about 30,000 pages of Prestel allocated to it. Now all the main home com-

puters are on line including the Spectrum. When you join you get a Modem, and full operating software that allows you to download the many programs that it carries. From the users point of view the system is protected by a double set of identification numbers. It is menu driven, with different sections for the various computers. There are also advertisements, news, clubs and an electronic mailbox.

The system is steadily expanding, but I fear the biggest problem is something they can do nothing about; ie, the poor state of British Telecom's phone lines. There are various mainframes running the system throughout the country, with a main one in London, which organises the mailbox, an excellent facility, but one that only works well if you live fairly near to the capital.

Nevertheless it is a system that can only grow with time, and is certainly a good way of keeping in touch with other computer friends. Contact Micronet for further details: Micronet 800, Bushfield House, Orton Centre, Peterborough PE2 0UW.

VOLUME OFF

David L Ward of Hibernia Point, Wolvercroft Road, London SE2, writes:

Q If you use a ZX Spectrum with a video recorder you can send the sound output to the television, by plugging a lead from the Spectrum Ear socket, to the Video Microphone socket, at least you can on my Sony C5.

But can you tell me if it is possible to turn off the internal speaker in the Spectrum. Not only do I always use the Spectrum through the video recorder, but sometimes the excessive sound in games becomes an annoyance, and I would rather play them in silence.

A The simple answer is no, at least not from software, unless you wanted to re-write part of the operating system in machine code, and then hope that this would not be lost when another program is Loaded in with it.

There is another alternative, and that is to cut one of the two wires between the speaker and the Pcb. (It goes without

saying that this would invalidate your guarantee.) Once done, you could wire a micro switch across the gap; it would then be possible to switch the speaker in and out as you wished.

VIC NEWS

Mr A A Morris of Woodward Road, Prestwich, Bury, Lancs, writes:

Q I am a Vic owner and I want to join a club. But the classified ads in your magazine seem mainly for software. I would like to meet other computerites, exchange ideas, have meetings and maybe paint some sort of monthly newsletter. Can you put me in touch with anyone?

A Yours is a common request and fortunately you live in a good position. The nearest club to you (not, though, tied to any specific computer), is in Bolton. Contact David Atherton, 16 Douglas Street, Manchester M29.

Perhaps closer to your exact requirements is ICPUG (Independent Commodore Products User Group). The national contact secretary is at 30 Bramcoates Road, Newbury Park, Ilford, Essex. Your nearest group is probably Clive Embrey, 17 Santon Avenue, Fallowfield, Manchester. There is also an association of Vic20 owners. For them you need to contact S. Tomnanek, 20 Milner Road, Sherwood, Nottingham.

BAUD RATE

Russell Lewings of Church Road, Hatfield, Peverel, Chelmsford, Essex, writes:

Q Is there any way of making the baud rate on a Spectrum quicker by using an add-on (not micro-drive)?

A It is theoretically possible to alter the baud rate. The tape routines in Rom would have to be copied into Ram. Once there, the timing would have to be altered. It is

not as easy as it sounds. I do not know of an add-on that does this, although it is possible they might become available in the future.

Whilst there would be obvious advantages in speed and the amount of tape you need, you may find that these advantages are out-weighed by the fact that with cassettes particularly the faster the baud rate, the more likely you are to get problems with the Load/Save operations.

Mr B Tidd of 160 Howlands, Welwyn Garden City, Herts: has sent me a long letter about copiers after my reply in the August 18-24 issue of PCW. He said that some copiers will copy any program, and goes on to name Autocopy 2. I don't disagree. What I actually said was, "I am surprised that so far no one has found a way of beating the copiers."

Mr Tidd goes on to explain that a copier can have a code key inserted so that it will crash if any attempt is made to copy it. True, but as a recent letters page has proved, it can be circumvented.

But it was the third part of his letter that intrigued me most. He asserted that a copier need never be overwritten, even if all the 48K Ram is used. I agree — if you can Load in blocks, and move the position of the copier in memory. But even so I cannot see how by doing this you can store a 48K program and however many bytes the copier takes up, in 48K.

Finally Mr Tidd offers an interesting challenge that I hope some readers will take up — to write an auto-Running routine in Basic, that does not involve moving Ramtop, and is not rendered useless when Merge is used. (Several people have written to me with routines, which fail when Merged.) I have printed this address in full, as he promises a copy of Autocopy 2 to the first person to send him a solution.

Is there anything about your computer you don't understand, and which everyone else seems to take for granted? Whatever your problem Peek it to Ian Beardsmore and every week he will Poke back as many answers as he can. The address is Peek & Poke, PCW, 12-13 Little Newport Street, London WC2R 3LD.

PROGRAMMED

The Commodore 64 is an excellent machine with poor documentation and poor Basic. Books teaching the rudiments of the machine have become an almost mandatory supplement to the manual.

Computer programming with the Commodore 64 seems to cover almost everything you could wish to know about Basic programming of the Commodore and is well illustrated with charts and diagrams.

Perhaps the most surprising thing about this book is the price £2.75 — haven't Hodder and Stoughton been told that computer books have to cost £5.95 at least?

TRIP FOR TWO

My name is Uncle Groucho — you win a fat cigar. Well, no, my name isn't Uncle Groucho but Automata's program's name is (if you see what I mean).

Understanding the above paragraph may be a good guide to your potential success at the program of the same name (as the Marx brother and as above).

Groucho the Marx brother is also Groucho the animated comedian in Automata's

game. You follow him from town to town as you try to guess the identity of various hidden personalities. For each personality you guess correctly (all film stars), you get a clue to the real Hollywood personality who forms the basis of the prize that's on offer — a trip for two to Hollywood.

A quick play suggests that Groucho is well up to Pimania standard and is full of the dubious programming, great jokes and ideas that made Pimania such a winner. Oh yes, the hit single on the reverse side is wonderful!

REDEFINED

Picture Writer is an extension of the standard Dragon Basic which is supposed to improve the graphics capabilities of the machine.

Text is displayed directly, so that it can be mixed with graphics. Other facilities allow text to be scrolled over graphics or text and graphics to be individually cleared.

In addition, the whole keyboard can be redefined and the new characters saved for future use.

DAN DIAMOND

It had to happen. There I was knocking out new releases on my typewriter, the kind of machine an elephant would find easy to use, and in comes this guy with a sack.

"Wanna parcel, mac?" Who does this guy think I am — Santa Claus? I could tell he wasn't one of the Popular staff — he had shoes on his feet.

"OK," I say; it wouldn't be

the first time curiosity got the better of this cat.

The parcel was a blast without a bomb. Diamond is back. That's Dan Diamond to you. Seems like the dude returned, he got out of Franklin's Tomb but now he's Lost in Space. What's that they say about frying pans and fires?

Diamond's still working for Salamander Software and his adventures in space are, as with Franklin's Tomb, graphically illustrated in a manual that comes with the cassette.

RACE TRACK

J Morrison Micros has a reputation for providing good quality machine code games for the Dragon.

Its latest release for the Dragon are Maurice Minor and Crusader — the latter is a seven-stage arcade game involving scaling walls and swinging across pits avoiding deadly scorpions and devilish dwarfs.

Maurice Minor is a racing game with some unusual features. You accidentally find yourself on a race track whilst out driving in your Morris Minor, your only chance for survival is to join all the other racing cars in their race and try to win. There is an added problem in that your car is gradually falling to pieces — can you cross the finishing line before the final bit drops off?

MACHINE CODE

Taking the view that the subject of machine code on the Spectrum is too great a subject for one book, Interface has tackled the subject in two — volumes one and two of Spectrum Machine Code made Easy.

The first book covers roughly the same area as the other machine code books on the market, ie, basic information on counting in hex, registers and simple programs.

Its complementary volume looks more closely at the Z80 and deals with jumping relatively, Anding, Oring, looping with double byte registers, Rom interrupts, etc.

An appendix includes Z80 instructions and mnemonics, system variables and a list of flags.

FRENCH TEST

Salamander — best known for Dragon software — has, in its latest group of releases, continued a gradual move into BBC programs with a utilities package, a flight simulator and French Tutor.

French Tutor is intended to provide both reference and testing on various aspects of French. The program has a dictionary of around 1,000 words and can test vocabulary, idioms and up to 20 irregular verbs.

There is also an option to create your own files for tests and storing them on tape. All accents including circumflex, grave, acute and cedilla are included and the program is compatible with all BBC operating systems.

NEW RELEASES

SUBLIME

It was victorious on the Vic and daunting on the Dragon, now it's likely to be sublime on the Spectrum. What is it? Why, *Gridrunner* of course.

Gridrunner is vaguely like *Centipede*, except that it is made more difficult by roving spaceships that patrol the fringes of the screen taking pot shots.

Although it doesn't boast the kind of spectacular graphics Spectrum owners

might expect from say *Ultimate*, it's not difficult to see why *Gridrunner* is so successful — it's very addictive.

There is no time to relax — from one direction or another, you are always within moments of attack. Expect bruised fingers.

Program *Gridrunner*
Price £6.95

DOOMED

Just what it is possible to fit into 3K seemed to change radically when Imagine swept into the Vic market with *Wacky Waiters* and *Arcadia*.

Imagine's latest release for the Vic is *Bewitched* and again it will work on the unexpanded machine.

The screen displays a maze — haunted labyrinths you have been doomed to roam by the evil magician, Mordread. Escape is nearly impossible, but there is a way out. The screen shows the maze, split

into three layers by doors. The doors are coloured, as are four keys located at the top of the screen. Matching the colours, you must open the doors and escape.

As, using the keys, you find your way through the maze, the minions of Mordread are unleashed, increasing their numbers as you progress. In order to try the next key you will have to run up the maze avoiding ever more baddies, as you get further down the maze so the run for the next key gets longer.

LINKED

Death Mines of Sirius is the first in a projected range of programs from Phoenix Software.

The programs are based on a novel idea — each package contains two cassettes, the first being an arcade-style game, the second being a graphics adventure.

The two programs are linked in a clever way, the arcade game contains clues to the adventure which are revealed as you begin to master it — in fact, the arcade game contains the most important information of all, how to start the adventure in the first place.

Death Mines of Sirius for the Dragon has, for its arcade part, a very good machine code version of *Lunar Lander* which involves not only land-

ing but also avoiding various meteors along the way.

Although the game is addictive and enjoyable in its own right, it also gives you the initialising code for the adventure if you get a good enough score.

Assuming you discover the code, you can begin the adventure which is illustrated with graphics, sounds and short animated sections. Although the response to the various prompts is single key in most cases, the adventure is nevertheless well above the usual Dragon quality.

Both sections are therefore impressive in their own rights and most Dragon companies would probably retail either part of the package at around £8 — which makes it excellent value at £9.99 for the two sections. Similar games for other micros including the Vic20 and the Spectrum can be expected soon.

WILD WEST

Gunsmoke for the BBC model B is a 3D simulation of a wild west gun fight.

The program, by Software Invasion, depicts the high street in a wild west town. From the doors of the shops and houses appear up to 16 deadly gunfighters.

You must control a lawman and fight off the bad guys until you have saved the day, or bitten the dust.

New Releases is designed to let people know what software is coming on to the market. If you have a new game or utility which you are about to release send a copy and accompanying details to: New Releases, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

Ziggurat

Mechanical Ideas

In a column such as this the writing part is a piece of cake.

The difficult bit is finding something to say. Getting the original idea.

Writing games software is similar in some ways. It is also supposed to be a creative process.

Virgin Games is — so we read (*Popular Computing Weekly*, September 29) — changing its approach to the software market. Virgin, remember, have not been as successful as was hoped when they first launched the company. Why? What was the reason for this relative lack of success?

Most people will tell you the reason is quite simple, many of the games were not good enough. Virgin originally collected the games together by advertising for individuals to supply games. Some were not very good, and Nick Alexander (managing director) puts this down to the fact that the programmers were just enthusiasts hobbyists.

I don't think I agree. The main reason why some of the games were not successful is surely the choice of the games in the first place: quality control in selection process.

Virgin apparently place the blame elsewhere, and Nick Alexander seemed to suggest that time is running out for the gifted amateur.

Virgin are now developing a system with a multi-user minicomputer, running advanced program development software. Programmers are apparently to be appointed from the computer courses at the country's top universities (when I read that in the original report, I laughed aloud).

So now we have an advanced system, designed for program development. All that is missing is ideas.

Give me the idea — give anybody who is reasonably competent the idea — and the program will be developed. The writing of programs requires some skill, but it is certainly not impossible. With the correct development software it is made even easier.

Ideas cannot be mechanised. If they are mechanised — they become mechanical.

The reason why certain games are not successful is sometimes the poverty of the writing, but more often than not it is the taintness of the idea.

I have seen many games which have brilliant effects in graphics and sound but which are so boring that all the machine code is wasted.

Though I am not a great adventure fan (I always seem to end up with a Bridge over troubled water), I usually find text adventures the most satisfying — the effects have to come from the ideas.

Virgin Games and many other companies seem to have reached a situation of over-kill.

When they have all these fantastic facilities, they will still need the ideas — and the enterprising individual will still have a place.

Boris Allan

Puzzle

A blinding problem

Puzzle No. 79

I popped into the printers the other day to collect some pamphlets.

Jack was packing up some hefty volumes. "There must be quite a few pages in those books," I remarked.

"Well," he said. "This is right up your street, because I happen to know that the number of pages in each book is a perfect square, as is the number of pieces of type that I needed to number all the pages."

"I bet you can't answer that one."

It was only later that I began working on the problem. Discounting the obvious answers of 1, 4 and 9, I was able to work out that if there had been 144 pages it would have taken 324 pieces of type to number them (there are 324 digits in the numbers 1 to 144).

However, the books were certainly larger than this. How many numbered pages were there in each book?

Solution to Puzzle No. 74

The sum is an alphabetic in which letters represent digits. As there are nine different letters, and we are told that zero is not present, then each digit must appear once and once only.

Thus, the smallest value possible for 'EIGHT' is 12345 so 'FOUR' must lie somewhere between 4123 and 9876.

10 FOR N = 4126 TO 9876 STEP 2 20 LET N\$ = STR\$ N 30 FOR A = 1 TO 3 40 FOR B = A + 1 TO 4 50 IF N\$(A) = "0" OR N\$(B) = "0" OR N\$(A) = N\$(B) THEN GOTO 210 60 NEXT B 70 NEXT A 80 LET Z = N * 3 90 LET Z\$ = STR\$ Z 100 FOR A = 1 TO 4 110 FOR B = A + 1 TO 5 120 IF Z\$(A) = "0" OR Z\$(A) = Z\$(B) THEN GOTO 210 130 NEXT B 140 NEXT A 150 FOR A = 1 TO 4 160 FOR B = 1 TO 5 170 IF N\$(A) = Z\$(B) THEN GOTO 210 180 NEXT B 190 NEXT A

This gives the answer of:

17496/5832 = 3.

Winner of Puzzle No. 74

The winner is: M. Madelin, Five Acres Close, Lindford, Bordon, Hants, who receives £10.
