# 48K ZX SPECTRUM COMPILER

### METEOROIDS

This version has been hailed the best: 3 sizes of meteoroids, saucer, wrap-around screen, bonus ship at 10000 points, amazing explosions, rotate left/right, thrust, fire, hyperspace and shield. Full feature 'arcade' sounds and full colour. Works with Joysticks (from us at £19.50). Only £4.95 inc (16K or 48K).

### SOFTIME

Amazing piece of machine code programming - produces a continuous real time clock on screen all the time - even when running/writing another program! Has alarm facility. For 16K or 48K, only £3.95.

**SOFTEK SPECTRUM SOFTWARE**

## COMPILER
### Benchmarks

| | BBC | SPECTRUM (BASIC) | SPECTRUM (COMPILER) |
|---|---|---|---|
| BM1 | 1.0s | 4.8 | 0.15 |
| BM2 | 3.1 | 8.7 | 0.09 |
| BM3 | 8.2 | 21.1 | 1.10 |
| BM4 | 8.7 | 20.4 | 0.99 |
| BM5 | 9.1 | 24.0 | 1.11 |
| BM6 | 13.9 | 55.3 | 1.91 |
| BM7 | 21.4 | 80.7 | 2.14 |

What the SUPER C compiler does is almost magical. It turns a program written in Spectrum BASIC into a machine code equivalent. SUPER C is child's play to use - simply type in a program as usual (or load from tape) and in a few key presses SUPER C turns it instantly into a super fast machine code version. It will compile virtually any Spectrum BASIC statement, plus a few features not available to you usually, but extra thought will be required for strings and floating point. There is no program you can write in BASIC which cannot be turned into a SUPER C version. However, enhancement packages will be available in the New Year to aid string handling, floating point, and will offer a host of other features - each for a nominal cost. With SUPER C your Spectrum will run faster than with either FORTH or PASCAL - and no new language to learn! SUPER C comes complete with extensive documentation, a manual written by Tim Langdell, example programs, and all boxed in a professional library case. Less than half the price of a compiler for any comparable micro, - £14.95 inc.

### 48K 3D MAZENTURE

A maze program and adventure in one. Amazing 'monster chase' animation and more than a hint of dungeons and dragons. 48K only, £5.95.

### THE ZOLAN ADVENTURE

A full adventure crammed into 16K! Quite astounding how extensive and engaging this program is. £4.95.

**SOFTEK, SPECTRUM SOFTWARE**

**NOW AVAILABLE FROM HILTON COMPUTER SERVICES**

(Author of the Best Banking Programs in the World)

**THE PBS BANK RECONCILIATION IS BELIEVED TO BE THE FIRST SUCH PROGRAM TO BE AVAILABLE FOR THE SINCLAIR ZX81 AND ZX SPECTRUM**

**Just look at some of its features:**

- Automatically matches bank statement items with transactions recorded in your **PERSONAL BANKING SYSTEM**.
- Lists all outstanding items such as uncleared cheques, funds received but not advised to you, bank charges — highlights all discrepancies. No more 'scratching around' to try and find out why your statement balance is different to what you expected.
- Full search facility, allowing on-screen correction of any item.
- Saves and loads data to and from tape (ZX81 version at double speed). Exchanges data with the PBS program. No need to save programs.
- Single key operation — uses machine code keyboard scan for single letter commands (ZX81 version).
- Extremely easy to use. No jargon to wade through before you get started. Demonstration program included.
- All item lists, searches (with totals). Can be output to your ZX Printer.
- Full instructions included.
- Unique after sale maintenance provided.
- Operates in conjunction with the 'Personal Banking System' (full input & correction facilities plus automatic posting of standing orders on due dates and fully detailed statements).

So banish the headaches, make life easier for yourself, send £15 for the **PERSONAL BANKING SYSTEM + PBS BANK RECONCILIATION** and users manual.

Existing clients need only send £5 for the **PBS BANK RECONCILIATION** which will operate with their present PBS.

**THE PERSONAL BANKING SYSTEM** (as reviewed in Popular Computing Weekly — 1st July) is available separately for £9.95 for cassette & user manual. ZX81 PBS owners can order the Spectrum version for just £5.

Please specify whether ZX81 (16K) or ZX Spectrum (48K)

**GUARANTEED SOFTWARE AVAILABLE FROM**

**HILTON COMPUTER SERVICES, 14 Avalon Road, Oprington, Kent BR6 9AX**

**YOUR PBS IS NEVER OUT OF DATE!**

# JOYSTICKS

## ZX Spectrum / ZX81

£23.50 INC. VAT & P+P

FOR ONE JOYSTICK AND INTERFACE MODULE

**BUILT, TESTED & READY FOR USE**

- ★ **NO SOLDERING,** interface module plugs into rear connector between ZX and Ram Pack, Printer etc.
- ★ **NO SPECIAL PROGRAMMING,** Joystick 1 simulates cursor movement keys 5 to 8 through interface module.
- ★ **IMMEDIATELY COMPATIBLE WITH ALL SOFTWARE** using the arrow keys for movement.
- ★ **TWO JOYSTICKS** connect via one interface module.
- ★ **EIGHT DIRECTION, SELF CENTRALISING ACTION** with integral 'FIRE' button.
- ★ **FREE 'VIDEO GRAFFITI'** program & full instructions.

*IMPORTANT: Use will not invalidate your Sinclair guarantee.*

# CONTENTS

**Letters . . . . . 8**

Your thoughts and opinions on the Sinclair range of computers and the industry in general.

**Numerology . . . . . 13**

What's in a name? Type in your friends' names and find out!

**Space Adventure . 16**

Take a flight of fancy through the final frontier.

**File Card . . . . . 20**

Get all your data on file with this easy-to-use program.

**Drainpipes . . . . . 24**

A clever re-working of the classic mechanical arcade game.

**Proctim . . . . . 27**

Turn your ZX81 into a process timer — no photographic studio should be without one.

**Memory Remaining . . . . . 28**

A useful machine code routine to tell you a little bit more about your memory.

**On Your Spectrum 30**

Phil Garrett takes a critical look at some of the latest Spectrum software.

**House Names . . . . 34**

Names, but no numbers? Here's a program to help you to get a clear picture of those difficult addresses.

**Prize Of Your Dreams . . . . . 37**

The software companies seem to be literally giving money away these days!

**Soft Options For Your ZX81 . . . . . 38**

Reviewer Nick Pearce checks out some software packages for your ZX81.

**News . . . . . 43**

All the news from Sinclair as well as the latest software and hardware add-ons.

**Club Corner . . . . . 48**

Ever thought of joining a computer club? Here's your chance.

**Sums And Fun For Infants . . . . . 52**

A superb educational package for the younger Sinclair user.

**Defending Your Spectrum . . . . . 58**

A great game for your ZX Spectrum — won't those aliens ever learn?

**How I Learnt Machine Code . . . . . 60**

Ian Turtle describes the heartache of writing his first machine code program.

**Scrolling That Screen Window . . . . . 63**

Scrolling made simple. As Eddie Waring would say "it's an up an' under".

**Rat Race . . . . . 66**

Join the rat race with this program.

**Diary . . . . . 70**

Never be short of date when you've typed this into your ZX81.

**Motor Test . . . . . 74**

An educational program to drive your ZX81 to the limits.

**In Search Of Adventure . . . . . 78**

Our reviewer, Paul Holmes, takes an adventure on his Spectrum.

**Purchase / Sales Ledger . . . . . 81**

Two programs for the price of one!

**On The Density Of Prime Integers . . . 85**

All you ever wanted to know about prime integers but were afraid to ask...

**What Can I Do With 1K . . . . . 91**

If you thought 1K was restricting, just wait 'till you've read this article!

**Mastering Machine Code On Your Spectrum . . . . . 94**

More from the machine code master, including two great programs to show off on your Spectrum.

**Home Run . . . . . 99**

Get home as fast as you can with this program for your ZX81.

**Derby Day . . . . . 101**

Have a day at the races . . . ZX81-style.

**Bookshelf . . . . . 102**

A brief look at some of the books available to help you make the most of your Spectrum.

**Competition . . . . 107**

A chance for you to win some Spectrum software.

**Conquering LOAD / SAVE Problems . . 108**

Some good hints on how to make sure of RUNning those programs from cassette.

**Spectrum Breakout . . . . . 110**

A version of the classic arcade game for your Spectrum.

**In The Air Tonight . . . . . 113**

Take your ZX Spectrum on its maiden flight. Our reviewer has a look at a couple of cassettes and gives us his verdict.

**Mastermind '80 . 117**

Don't pass up this great game for the ZX80.

**Spectrum Maze . 118**

This program will have you running circles around yourself!

**Educational Software . . . . . 121**

A personal look at the field of educational software.

**First Steps In Programming . . 122**

Tim Hartnell takes a beginner's eye view of the ZX81 keyboard.

**Machine Specifications . . 127**

A reference guide to the Sinclair range of products. It's all here.

**ZX Computing is constantly on the look-out for well-written articles and programs. If you think that your efforts meet our standards, please feel free to submit your work to us for consideration.**

**All submitted material should be typed if possible; handwritten work will be considered, but please use your neatest handwriting. Any programs submitted should be listed, a cassette of your program alone will not be considered. All programs must come complete with a full explanation of the operation and, where relevant, the structure; Spectrum programs should be accompanied with a cassette of the program (which will be returned) as well as the listing.**

**All submissions will be acknowledged and any published work will be paid for at competitive rates. All work for consideration should be sent to the Deputy Editor at our Charing Cross Road address.**

# ZX81

## THE HOME DOCTOR SERIES

Exciting Breakthrough In Home Health Advice

Announcing the launch of a series of computer programs designed to educate and advise on a comprehensive range of medical topics whilst being FUN to use.

The text has been prepared by Dr Vernon Coleman who writes from 10 years experience in a busy general practice, and who is widely acclaimed for his many books on medical topics.

The cassettes in the series cover the following topics:

1. Basic Medicine
2. Mainly for Women
3. Mainly for Men
4. All About Children
5. How Healthy Are You?
6. 101 Home Nursing Tips

The computer programs are not intended to replace professional medical advice but rather to complement this by educating users on preventitive medicine and how to cope with medical problems when they arise. The programs would therefore be equally useful in schools, homes and in industrial applications as part of health screening programs.

Each cassette costs £6.75 plus 45p postage and packing although as a special offer to Micro Decision readers all 6 cassettes are available for £35.75 post free.

Users should indicate whether they require a 16K RAM pack to run all of the programs. Please allow 28 days for delivery.

EASTMEAD COMPUTER SYSTEMS LTD

## ZX81 & Spectrum Games

**Chess 1.4:** Ten levels m/c graphic screen display.
***16K ZX81 £8.95***

**Invaders:** Very fast m/c action. Includes mystery ship and increasingly difficult screens.
***16K ZX81 £4.45***

**Mazeman:** A fast action m/c game that reproduces the spirit of the original. The Spectrum version includes excellent graphics.
***16K ZX81 £4.45 – Spectrum £4.95***

**Adventure 1:** Based on the original game by Crowther, this game was the start of the Adventure craze. Reviewed Sinclair User, issue 2. Features Save game routine as the game can literally take months to complete.
***16K ZX81 £8.95 – 48K Spectrum £9.95***

We have full stock of all programs and supply by return of post (which is included in the price)

# D J MOODY COMPUTER SOFTWARE

# 16K SPECTRUM COMPETITION

## GAMES

**ADVENTURE SERIES..... All £5.00**
**The Series..... £16.00**

For the 16K ZX81 and ZX Spectrum. These Adventures are linked together using data storage above RAMTOP. All can be played independantly of the others. You must complete certain tasks to continue to next Adventure.

**ADVENTURE-1.** 100 caves, 50 treasures, ghosts, a magician, goblins and trolls all out to get you. Graphic display. Half-a-mo.

**ADVENTURE-2.** Deep sea adventure with 30 wrecks, 50 treasures, Jelly fish, octopus and sharks, Graphic display. Half-a-mo.

**ADVENTURE-3.** Land based adventure with 50 locations, 70 treasures, ghosts, vampires, monsters, snakes, Father Christmas and his elves. Graphic display. Half-a-mo.

**ADVENTURE-4.** Space adventure with 30 stars and planets to visit, 70 treasures, Alien starships, pirates etc. Graphic display. Half-a-mo.

**Note:** Half-a-mo is our save game feature for stopping a game while playing and returning to same position upon reloading.

## COMPETITION

### CONDITIONS OF ENTRY

1. One entry form is supplied with every cassette purchased. No limit to the number of entries per person.
2. Closing date is last post on February 15th 1983.
3. Prizes.
   1st prize is a 16K Spectrum and £20 worth of our software.
   2nd prize of £20 worth of our software.
   10 runner-up prizes of £10 worth of our software.
4. Entries must be on official entry forms. No copies accepted.
5. No correspondance will be entered into. Winners will be notified by post.
6. Entry will be construed as acceptance of all conditions.

## ORDERING

See our range of Software at Wallasey Software, 3 Monmouth Rd, Wallasey, Merseyside.

**TRADE ENQUIRIES WELCOME**
Cheques payable to:
**D J MOODY COMPUTER SOFTWARE** or **D J MOODY**. Prices are all inclusive. P&P is free. VAT is charged at 15%. Orders dispatched within 48 hours. 6 month guarrentee. State ZX Spectrum or ZX81. Orders to:
**Dept ZXC, 1 Starnhill Cottages, Granby Lane, Bingham, Nottinghamshire NG13 8DH.**

## UTILITIES

**AS/DIS.** Hex assembler and disassembler for the machine code user. 5000 bytes reserved. Functions: Hex load assembles hex code. Hex dump disassembles code. Hex clear clears parts of memory. Hex save saves named program..... **£5.00**

**CASSETTE DESIGN.** To help you store your own tapes this program will use the ZX Printer to print your own designs. These are used as inlay cards. It will store up to 10 designs. Save routine..... **£5.00**

**WORD SQUARER.** This program will help you solve word squares such as the one in Computing Today, September. Max. dimensions are 20×30 characters. Searches N, S, E, W, NE, NW, SE, SW. Save routine **£5.00**

**DISASSEMBLER.** Decodes bytes in memory to Z80A mnemonics. All shifts calculated correctly. A very handy tool..... **£5.00**

**ASSEMBLER.** Type in normal Z80A mnemonics and this program will turn them into their codes and load them into memory. Full editing facilities..... **£5.00**

**METRIC CONVERTER.** Main converting section will convert Length, Area, Volume, Velocity and Mass. Gives table printout. Hundreds of conversions possible..... **£5.00**

**DATA FILE.** The newest and most flexible Date filing system yet. Any memory size. Files any length, 20 zones within a file. Functions: Find file, Delete file, Amend file, Search file x – zone y for X$ Swap file, Lprint file, Alphabetical ordering Inverted ordering. The best at only..... **£5.00**

NEW! ZX SPECTRUM TAPE NOW READY!
NEW! EXPANDED DISC VERSIONS FOR APPLE, PET AND SHARP!

NOW AVAILABLE FOR THE ZX SPECTRUM!

# THE VALLEY

© ASP LTD 1982

## What are you... Barbarian or Wizard?

Choose your character type carefully... Barbarians recover quickly but their magic doesn't come easily. A Wizard? Slow on the draw and slow to mature...but live long enough and grow wise enough and your lightning bolts are almost unstoppable...

The Valley is a real-time game of adventure and survival. You may choose one of five character types to be your personal 'extension of self' to battle and pit your wits against a number of monsters. Find treasure, fight a Thunder-Lizard in the arid deserts of the Valley, conquer a Kraken in the lakes surrounding the dread Temples of Y'Nagioth or cauterise a Wraith in the Black Tower. In fact, live out the fantasies you've only dared dream about. BUT BEWARE...more die than live to tell the tale.

The Valley runs in a 48K Spectrum (a 16K version will be available shortly) and makes full usage of the excellent colour and graphics capability of the machine. As you battle your way up the ratings your character can be saved onto tape, to re-enter the Valley another day — if you dare!

Full instructions are included with the game, but if you want more detail on the program, a 16 page reprint of the orignal 'Computing Today' article is available at £1.95 all inc.

If you have the courage, the Valley costs only £11.45 all inc. from ASP SOFTWARE, 145 Charing Cross Road, London WC2 0EE.

Please send me...tape(s) of The Valley at £11.45 per tape all inc.
and.....listings at £1.95 each.

# Welcome

First of all, I hope you all had a nice time over the Christmas holidays, and welcome to those of you who received a little 'computing something' from Santa Claus and are eager to flex your programming skills in the absorbing hobby of home computing. Within these pages, you'll find lots to interest you, with features and programs for the complete range of Sinclair computers as well as useful hints and routines for the experienced and inexperienced user alike.

## A fresh face

As you may have noticed (if you've taken a PEEK at the name at the end of this column), Tim Hartnell has departed the Editor's chair of ZX Computing. Tim has decided to concentrate on writing books for the time being. After all, now that a certain computing magazine has crowned him the 'Barbara Cartland of the computer book field', Tim feels he has to do something to keep his image shining!

Nevertheless, he has not departed these pages for good, and we will bring you his wise words of wisdom in future issues. We will also try to maintain the very high standard he set for *ZX Computing* in the first four issues.

Indeed, in this issue, we have a wealth of material for the machine code programmer, continuing Toni Baker's splendid series on 'Mastering machine code on your Spectrum' as well as Ian Turtle re-living some of the traumas of writing his first program in machine code. For those of you searching through the wide range of commercially available software, our reviewers have been busy sifting through the latest cassettes to help you make your choice. We also take a brief look at the huge selection of books available for the Spectrum user.

## And now for the good news

Thank you to all those of you who write in to us at *ZX Computing*. As you can see from the wide range of correspondence on the following pages, we certainly have some very interesting readers out there. So, keep those letters coming — it's good to hear your views on the magazine, the industry in general and your discoveries on your computer.

Also, I hope you'll notice the Club Corner page. If you would like some free publicity for your users' club then please write and tell us, giving as many details of times of meetings, places, etc. Joining a club can often be the most important move you make to getting the most out of your computer, so check this page out and see if there's a club near you.

As you read through the letters, I hope you'll notice that there is a lack of letters complaining about Spectrum deliveries. I 'phoned Sinclair the other day and was told by a spokesperson that 'there are now no delivery delays for the ZX Spectrum personal computers'. I was also pleased to hear that the backlog of orders were completely cleared by the end of October, 1982, and that all new orders were being fulfilled within the customary 28 days. Good news indeed.

## Contributions

We are always on the lookout for good programs and articles for future issues of *ZX Computing*, and where better to look than to our own readers. If, when reading through the magazine, you think you can write programs as well, or better than, our present contributors, then let's hear from you.

All contributions are, of course, paid for at very competitive rates. So, if you've got your eye on a new ZX add-on or you'd just like to supplement your pocket money, get writing! It is vital, though, that all the programs you send us are totally original, and not 'borrowed' or 'adapted' from other magazines or books. (When Tim was sitting in the Editor's chair, he even received 'original' contributions he himself had written for his own books!)

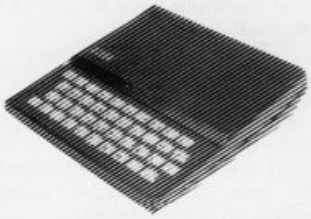
Any kind of program (business, domestic, educational, or just fun) will be welcomed, but particularly those which use ZX BASIC in clever and efficient ways, or those which employ certain routines which can be re-used in other programs.

Program listings are vital, along with a clear explanation of how the program is constructed, what it does and what the user can expect to see once the program is RUN (a screen dump is particularly valuable in this respect). When submitting Spectrum programs, it is very important to remember to enclose a cassette of the program as well as the listing, as this will allow us to check the program before publication.

## End byte

I hope you enjoy the contents of this magazine, and that it encourages you to write your own programs to utilise the full potential of your Sinclair machine. But enough of me, I suggest you now get down to the serious business of making the most of your micro with *ZX Computing*.

**Roger Munford.**



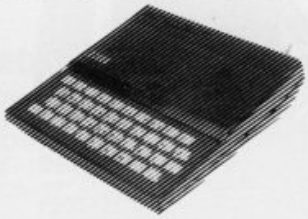
## No address

Dear ZX Computing,
You kindly reviewed our '0' Level Maths software in the August/September issue of *ZX Computing*. However, since then several people have told us of the difficulty in finding our address as it was not given in the article.

As you did mention other people's addresses, we should be glad if you would list our's.
Yours faithfully,

Avril Cowley (Mrs),
Rose Cassettes,
148 Widney Lane,
Solihull,
West Midlands B91 3LH.

● *Sorry about that Avril, these things do happen. I hope that we have more than made up for our omission in the review.*



## Thanks a lot!

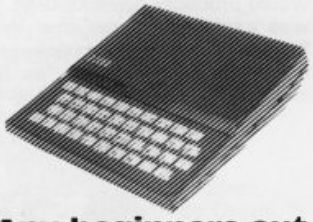
Dear ZX Computing,
I don't know if it's possible, but through your columns I would like to thank Mr Mike Salem of Hilderbay Ltd, 8/10 Parkway, Regents Park, London NW1 7AA.

I was having problems loading tapes on my ZX81 and when I tried a financial package from Hilderbay had the same difficulty. Mike Salem checked out the tape I returned and reported back to me and sent me another tape by return of post with tips on loading. Needless to say I have had no more trouble.

In fact, I now have a copy of Hilderbay's book entitled ***The Microcomputer Users' Book of Tape Recording*** which I have found very comprehensive on all aspects of recording, tape recorder and cassette care, loading problems, etc, etc. I think this book has only recently been published.

I very rarely write to magazines, but in this case I feel that I would like to pass on the name of a company offering good service and a willingness to help the 'amateur'. I am in no way related or in fact have never met Mr Salem or anyone from Hilderbay.
Yours faithfully,

JG Marshall,
Sutton Coldfield,
West Midlands.



## Any beginners out there?

Dear ZX Computing,
As a recent initiate into the fascinating world of home computing through the purchase of a ZX81, I was so intrigued to see a magazine devoted entirely to ZX computing, I bought issue number 3. In many ways it was a revelation. I had not realized just how many plug-in accessories were now available nor thought much about some of the things which could be done with a ZX computer. It certainly increased my thirst to progress further in the art of programming!

However, in some ways your magazine was also a disappointment. I appreciate your desire to maintain a high standard for published programs, but this need not imply that only long programs are worthy. Yet issue 3 contained very few programs suitable for the standard 1K version of the ZX81, and most of those that were suitable utilised machine code. Beginners (ie would-be experts?), on finding problems with, or wanting to improve upon, such programs would be faced with great difficulty because of a lack of understanding of machine code. Thus, I would appeal to you to put in more material aimed at the beginner. Good, short programs in BASIC, perhaps with a brief explanation of the logic used in them, would be much appreciated I am sure. And the space would not be wasted; after all, today's 1K ZX81 enthusiast is tomorrow's 48K all-singing, all-dancing Spectrum owner!

Perhaps by way of illustration, I could explain a problem which occupied me for several hours recently. I am still working my way through the ZX81 BASIC programming manual which comes with the computer and have reached Chapter 18. On page 121 is a subroutine for drawing an almost straight line from a pixel (A,B) to a pixel (C,D), for use with a program which would generate numerical values of the co-ordinates A,B,C and D. For the purpose of what will follow, imagine the subroutine to be prefaced by a simple set of INPUT statements, as below:

```
10 INPUT A
20 INPUT B
30 INPUT C
40 INPUT D
50 GOSUB 1000
60 STOP
```

Excluding REM statements, the subroutine given in the manual is 26 statements long, and the logic is fairly difficult to follow. I could not avoid feeling that there must be an easier way of programming the drawing of a line which utilises the slope of the line. Indeed, the program represented by lines 1000, 1010, 1030-50, and 1100 (see below) draws a perfectly good line providing the slope (Y/X) is less than or equal to 1. However, for slopes greater than 1, gaps appear in the line since only one pixel is plotted for each value of N. When X = 0 (ie a vertical line) the computation breaks down completely because the slope is infinity. The problem of X = 0 can easily be overcome by a statement such as:

```
IF X=0 THEN LET X=.5
```

Unfortunately, all of my attempts to write a FOR. . . NEXT loop for a variable Q (of value 0 to the slope of the line), which would allow extra pixels to be plotted at any given value of N, resulted in complications. However, the solution of the problem was really very simple: if the slope of the line when viewed from the X axis is greater than 1 (ie Y/X>1), then the line viewed from the Y direction has a slope less than (ie X/Y< 1). Use of this fact allows a very simple subroutine to be written, as follows:

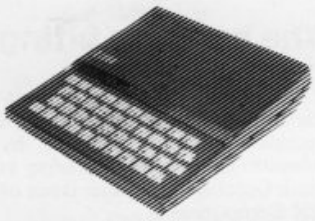
```
1000 LET X=C-A
1010 LET Y=D-B
1020 IF ABS Y >=ABS X
     THEN GOTO 1070
1030 FOR N=A TO C STEP
     SGN X
1040 PLOT N, B+Y/X *
     (N-A)
1050 NEXT N
1060 GOTO 1100
1070 FOR N=B TO D STEP
     SGN Y
1080 PLOT A+X /Y *
     (N-B),N
1090 NEXT N
1100 RETURN
```

The result is a subroutine which involves only 11 lines, and which is conceptually simpler than that in the ZX81 manual. It also uses less memory, so that when used with the preface given above, a complete diagonal line from (0,0) to (63,43) or from (63,0) to (0,43) can still be drawn with the 1K version. This is not the case with the 'official' program.

I am sure this idea will not shatter the world of relatively experienced programmers, but beginners who are puzzled by the subroutine in the manual may find it useful.
Yours faithfully,

K Smith,
Mayols,
Swansea.

● *I appreciate your request for more information and programs for the beginner. In each issue, every effort is made to produce a balance between matrial for both the experienced and inexperienced. I hope that when you read through this magazine, you will find something to interest you.*



## What do you think?

Dear ZX Computing,
While investigating a bug in a program of mine, I typed in and ran the following program.

```
10 LET A=256
20 LET A=A/2
30 PRINT,A
40 IF A=0.5 THEN STOP
50 GOTO 20
```

This printed a series of numbers down the right-hand side of the screen, halving each time. However, when it got to 0.5 it did not stop as line 40 commands. Upon changing the number 0.5 to 1, it duly stopped as requested.

I also tried VAL "0.5" in the place of 0.5, but this too went wrong. Is it my programming ineptitude, or have I stumbled across another bug in the ROM.
Yours faithfully,

M Clayton,
Knaresborough,
North Yorkshire.

● *I think the 'bug' you have found is simply due to ZX81's division routines introducing a* ▶

*slight error in the continuous division you have asked it to do. Remember that if A is not* **exactly** *equal to 0.5 in line 40, the program will not STOP. Try substituting the following line instead.*

*40 IF INT (A * 2) = 1 THEN STOP*

*Hope this has cleared up your problem.*

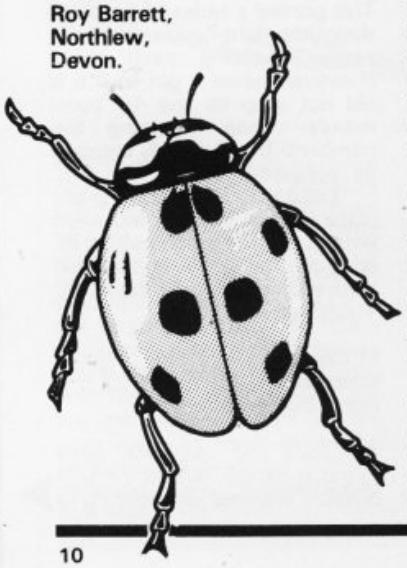
## The bugs are biting

Dear ZX Computing,
I would like to bring to your attention an error in the otherwise excellent program Bandit by Messrs. Cleverle and Waring in your October/November issue of ZX Computing.

This concerns the Hex loader at the beginning of the program. Used as listed, it will cause a syntax error on the first input. If line 10 is changed from INPUT X to LET X = 16514, all will be well.

I realise this is a small point, but one that could easily 'bug-up' a novice programmer indefinitely.
Yours faithfully,

Roy Barrett,
Northlew,
Devon.



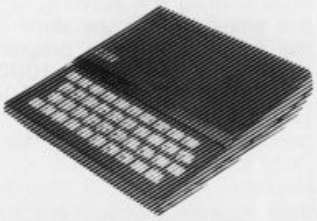
## Hold it a minute . . .

Dear ZX Computing,
While writing programs which draw pictures on the screen, I sometimes need to stop a program without showing a report code.

The method I use is to make sure the computer is in Slow mode, then LET L = USR 861. To escape from this routine, you merely press Break.

I hope this will be of use to other ZX81 users.
Yours faithfully,

Alexander Rogers,
Radlett,
Herts.



## Two's company

Dear ZX Computing,
I am undergraduate in Computation at the University of Manchester Institute of Science and Technology (UMIST) and have been an owner of Sinclair Research's ZX81 computer since March 1982.

I bought the ZX81 in kit form and it was supplied with a 1.2A PSU which is able to drive the ZX Printer.

I initially wanted the computer for hobbyist purposes, but recently I decided to put it to some commercial use. I thus decided that a printer would be of some use.

When I went to WH Smiths' to have a look at one, I noticed that it was supplied with another 1.2A PSU. I queried this at several branches of WH Smiths and at one, the assistant (whom I presume has had some training) even tried to persuade me that two PSUs were required simultaneously.

I realise that many Sinclair users were provided with a 0.7A PSU with their ZX81s and thus require an updated 1.2A PSU to drive the printer and computer together, but why cannot Sinclair Research provide the updated supply with the computer?

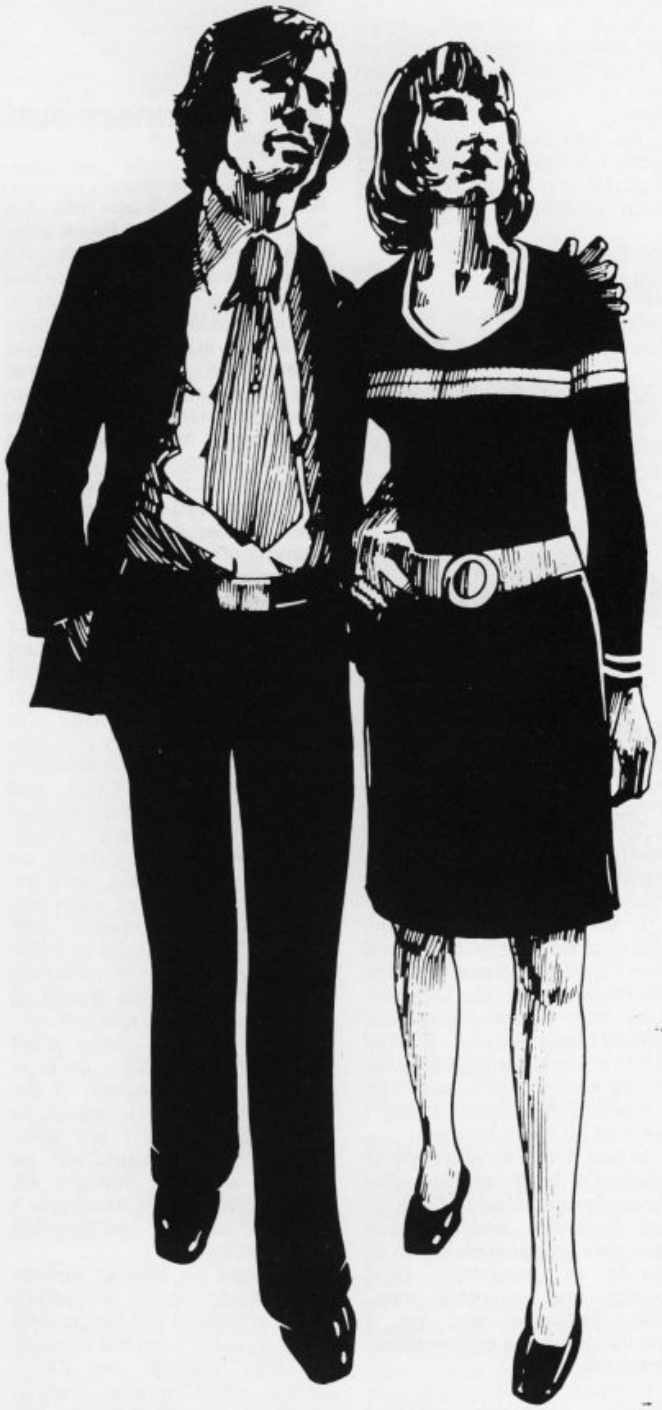
May I make this quite clear to potential buyers of the ZX81 system: when you buy your ZX81, you will in all probability get a 0.7A PSU with your machine. At a later date, if you decide to purchase a ZX Printer, you will get another PSU this time with a current rating of 1.2A. You will therefore have a superfluous PSU which you will have paid for.

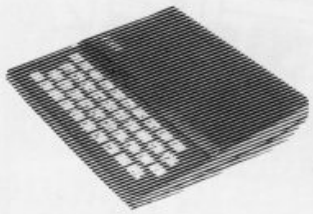
I recently spoke to a spokesperson from WH Smiths who made no secret of the fact that consumers would end up with two PSUs and one of them would probably be redundant. It was explained to me that WH Smiths have to accept packages from Sinclair Research 'as is' and therefore have to sell them as such.

This experience brings me to two conclusions: Uncle Clive is severely lacking in consumer relations and WH Smiths should train their staff properly!

I would be most interested to hear other Sinclair users' views on these matters.
Yours faithfully,

Alan Turnbull,
Stockport,
Cheshire.





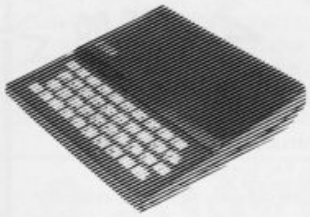
## ZX tipster

Dear ZX Computing,
While looking through D Jones' article on tips to improve your programs, I found this:

```
10 POKE 16418,0
20 PRINT AT 23,5;"
   ■■■■■■■■■■■■"
30 POKE 16384,74
```

Can anyone improve on this?
Yours faithfully,

J Crawford,
Beccles,
Suffolk.



## ROM bug?

Dear ZX Computing,
On writing a program for my ZX81, I think I have discovered a ROM bug. Consider the following program.

```
10 FOR N=20 TO 30
20 LET A = SQR N
30 PRINT A;"--5"
40 IF A=5 THEN PRINT "THEY
   ARE EQUAL"
50 NEXT N
```

As you can see, when N attains the value of 25, SQR N should be 5 and the screen should display the message from line 40.

However, this does not happen. I have even tried this on a friend's ZX81 just to be certain it was not a malfunction on my own machine.

The problem can be solved if you write:

```
40 IF INT A=5 THEN PRINT
   "THEY ARE EQUAL"
```

But then the next declarations won't be accurate. The best solution would be to use the following lines:

```
20 LET A$ = STR$ SQR N
30 PRINT A$;"--5"
40 IF A$ = "5" THEN PRINT
   "THEY ARE EQUAL"
```

To be certain that the problem is not from the FOR. . . NEXT instruction, try the following with the first program.

```
5 LET N = 19
10 LET N = N+1
50 GOTO 10
```

Hoping to have contributed to the war against bugs.
Yours faithfully,

Paulo Ricardo Plath Xavier,
Bairro Dr Augusto de Castro,
Lote 9 2°B,
2780 Oeiras,
Portugal.

## What's your problem?

Dear ZX Computing,
I would like to ask your advice concerning the 16K RAM Pack. I recently borrowed a 16K RAM Pack from a friend but I have a lot of problems trying to load my programs.

I have tried various volume and tone settings, but nothing seems to load. When I load 1K programs, I have to disconnect the RAM Pack. Please help me.
Yours faithfully,

Paul Gingell,
Killiney,
County Dublin,
Ireland.

● *In this issue, Paul, we have included an article covering some of the problems of LOADing and SAVEing which I hope will be of some help to you. Perhaps you may like to try the tip explained in the letter from Oswald Baruch.*

## How long?

Dear ZX Computing
My interest having been aroused by your program 'Getting primed' (*ZX Computing*, Aug/Sept 1982, page 73), I decided to try the program.

In Slow mode, after 47 hours and 10 minutes, without any signs of over-heating, the printer came with your 10,000th prime, and the ZX carried on, as happy as ever. I modified the program so that only primes 9990 to 10010 were printed, the others were only displayed on the screen, which I turned off most of the time.

I was once again impressed by what this little machine can do.
Yours faithfully,

Dr. Dick Zeilstra,
Zu den Rehwiesen 9,
4100 Duisburg 1,
W. Germany.

## Simple as 1, 2, 3

Dear ZX Computing,
I was about to join all those who are complaining about the difficulties with LOADing. However, in the wake of my 'experiments' to get this operation more reliable, I am persuaded that all is not lost. I have discovered a way of checking the quality of a recording, without losing the program.

Carry out the following:

1) After writing and debugging a program, save it on a cassette, preferably 'from within' (with the SAVE as a program instruction).
2) Do not type NEW.
3) Type LOAD and the program name.
4) Rewind the tape to the beginning of the recording, adjust the volume to the correct level (or what you assume to be the correct level) and start the tape.
5) Press Newline and watch the screen.
6) If the recording on the tape is good, the program will load normally into the computer, and often the loading will start to work if recorded 'from within'.
7) If the recording is faulty, there are two possible things that could happen:
i – during loading, the silence pattern appears on the screen.
ii – at the end of the loading, the silence pattern appears on the screen.
8) If the silence pattern shows up, press the Break key. The program which was previously in the computer will reappear either immediately or after pressing Newline.
9) Now, you can attempt a new SAVE.
10) Repeat the above steps until all check up to point six are positive. Now, you have really SAVEd your program.
Good luck!
Yours faithfully,

Oswald Baruch,
20306 Nesher – Givat Amos,
PO Box 1049,
Israel.

# Numerology

## Gary Nugent, from Dublin, presents a program which will tell you a little bit more about your friends. All you have to do is type their names in, the ZX81 does the rest.

Numerology is a program written for a ZX81 with 16K RAM Pack which will reveal aspects of a person's character from their name.

Simply type out your name (or anyone else's), separating each name – Christian name and surname – by a space, followed by Newline. Hyphenated names and initials are also catered for. The computer will then calculate the Full Name Number by allotting each letter of the alphabet with a number. Based on the Full Name Number, you will see a display of a character outline for that person.

Try typing your friends' names in – the results may surprise you!

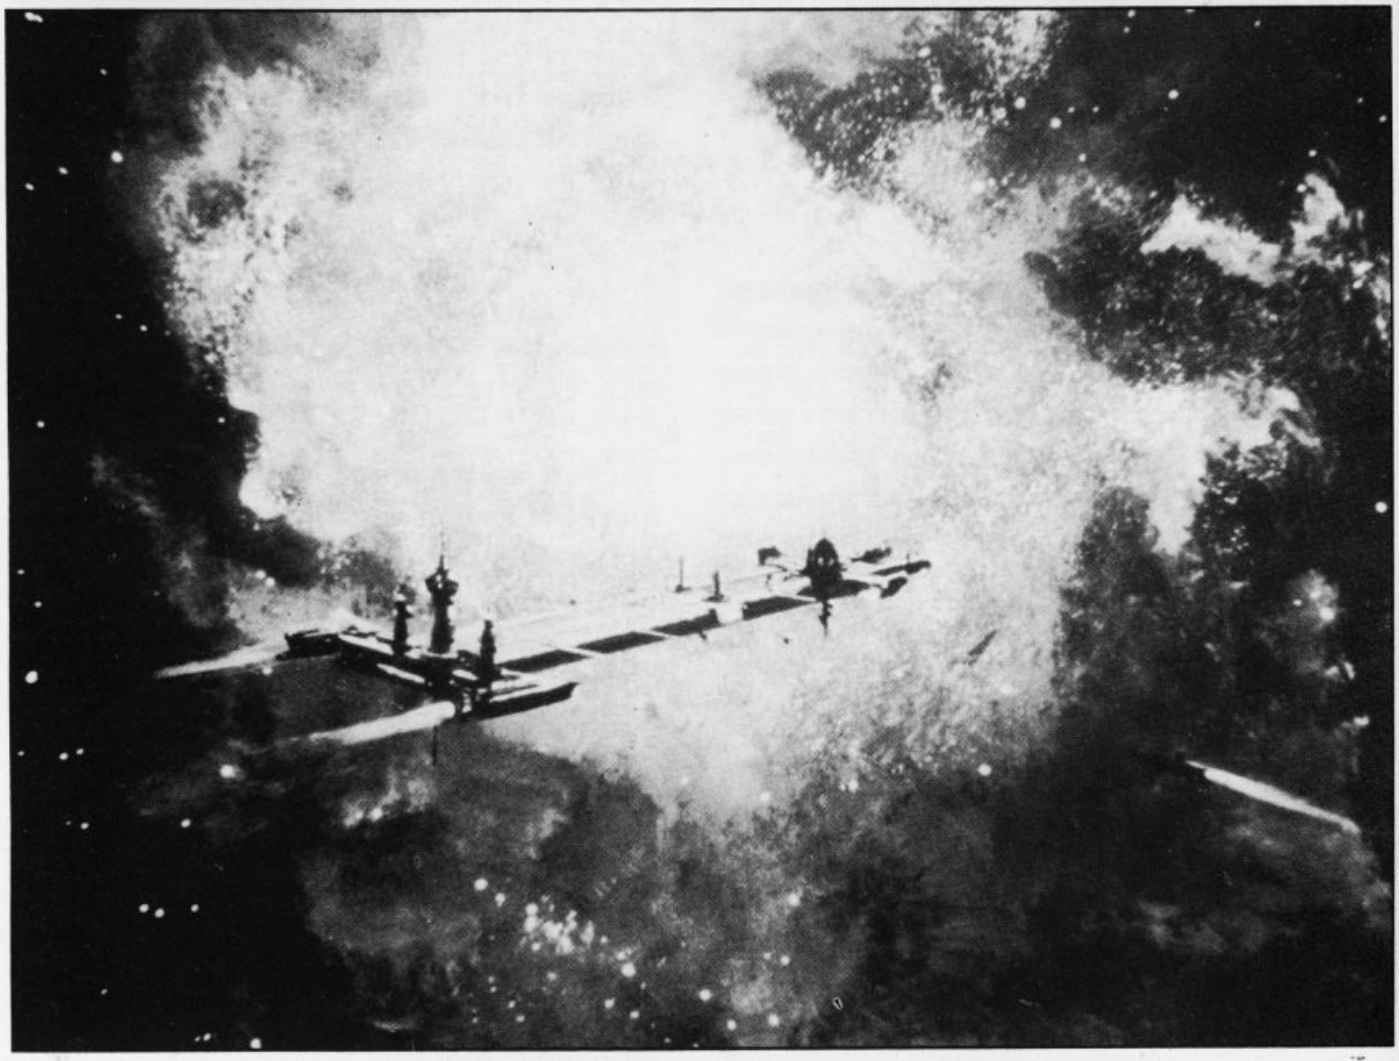
# Space adventure

## Fourteen year old David Lambert delves into outer space with a great program for the 16K ZX81. All you have to do is reach Earth before the aliens get you . . .



Photograph courtesy of Walt Disney Productions.

Space Adventure is a game for the ZX81 with 16K RAM Pack. You are travelling in a space ship journeying back to mother Earth. The trouble is that there are a number of nasty aliens who are out to get you!

You first choose how long you wish the game to last, then your fuel and estimated time of arrival are calculated in lines 3 and 4. When an alien approaches, you will get a warning on screen and it is then up to you to choose your course of action. You can either increase your speed, take evasive action, enter hyperspace or, as a last resort, scuttle your ship. However, if you take evasive action, you will use up more fuel than if you increased your speed. You only have a limited amount of fuel so care must be taken in your choice. If you have not enough fuel to finish the run to Earth, you will get a message on the screen warning you of this and you will have to leap into hyperspace to get your estimated time of arrival down.

Your star ship also has the capability to fire missiles at any annoying aliens, but be warned, if you score a direct hit the aliens will not always be blown up — they might have their protective shields up to deflect your missile. If they do have their shields up, it is very likely they will fire at you so be prepared for quick evasive action.

### All's well . . .

There are several ways for the game to end: your ship could be blown up; you could scuttle your own ship; you could run out of fuel; your engines could overheat; or the explosive missiles you are carrying could accidentally be triggered. Of course, if you manage to reach Earth after your journey you will be rewarded with a 'Well done' message which is generated in lines 2070 to 2130. You will also be told how many aliens you managed to do away with on your trip home.

Here is a table of the variables used in the program to help you follow how David has put the listing together.

| | |
|---|---|
| F — | Fuel. |
| E — | Estimated time of arrival. |
| K — | Kills. |
| T — | Temperature. |
| TRAV — | Game length. |

NEW SPECTRUM SOFTWARE

48K SPECTRUM

## "Shaken But Not Stirred"

A James Bond 007 Adventure.

You are secret agent James Bond, No. 007, with a licence to kill. Your task is to locate and disarm a nuclear warhead which has been kidnapped by the mysterious Dr. Death. You try to follow his trail across the continents to his secret island where he is holding the missile. But he has some surprises in store for you!

Even with your range of death defying gadgets you may not manage to escape from the maze of his underground hideout – if you can find it that is!

Anyway, watch out for his henchmen, the steel fisted giant 'PAWS', and the deadly midget 'TIC TAC'. If you finally manage to get through the on screen three dimensional maze, locate the control room, disarm the warhead, and think you deserve a drink, then rush back home for a Vodka Martini – 'SHAKEN BUT NOT STIRRED'

Can you resist being 007? **£6.50**

16K SPECTRUM & 48K SPECTRUM

## Everest Ascent

Stake your claim to the Top of the World in this gripping vertical adventure in which you aim to conquer the 29,141' summit of the world's highest peak.

Struggle from base camp to base camp in defiance of all the obstacles which man and nature can throw at you! Survive intense cold as you watch out for avalanches, thin ice and, of course, abominable snowmen! Cope with wayward Sherpas and cross bottomless crevasses but remember to watch your oxygen supply! A game of skill, cunning, bravery and daring for those with a head for heights!

For the 16K Spectrum we have divided this game into exciting parts to give you an adventure as complex and varied as the 48K version.

For the **16K or 48K** Spectrum only **£6.50.**

48K SPECTRUM

## Transylvanian Tower

A spine-chilling adventure with spectacular 3-D graphics. Can you rid the world of Count Dracula before he introduces you to the dark world of the living dead? Horror film addicts will know most of the moves, but we've also added a few of our own! Can you discover the mystery of the turret and escape with its treasures?

Enter via the dungeons and work your way up to the terrifying top! Find objects to help you whilst exploring the 500 rooms – all in exciting 3-D detail – but watch out for the bats.

Give your Spectrum a bite of the action now!

Includes full save routine for use during the daylight hours! **£6.50**

16K SPECTRUM

## Ship of the Line

An Adventurous Management Game

Command a 17th Century sailing ship . . . win victories for Britain . . . juggle your supplies, manpower and ammunition . . . fearlessly battle your way up the ranks . . . and finally achieve promotion to First Sea Lord, but beware . . . it won't be easy! Encounter and engage enemy fleets . . . survive sunstroke, fever and famine . . . endure fire, fog and thirst . . . then . . . when you think you've done well . . . rush back to Port for promotion! With full colour, ship graphics and sound . . . **£4.95**

48K SPECTRUM

## Ship of the Line

48K version features the chance to send out boarding parties, to build up prize money, to take intelligence tests and to bribe your way up the admiralty ladder! This greatly extended version of Ship of the Line really makes the most of your extra memory. **£6.50**

16K ZX81

## Bargain Bytes Cassette One

Deep Sea Adventure * Bank Account * Underground Adventure * Depthcharge * Hangman * Loan Calculator * Codebreaker * Foreign Currency Calculator. A genuine bargain!

Eight interesting programs for just **£5.00**

16K ZX81

## Bargain Bytes Cassette Two

Stock Market Game * Seafaring Adventure * Jackpot * OXO * Financial Model * Ski Run * General Knowledge Quiz * Copycat.

Too many programs to desribe for only **£5.00**
Ideal as a ZX81 Starter Pack!

48K SPECTRUM

## Multi Function Cash Controller

If you want to make your machine work for you, this is an ideal program . . .

Cash Controller has four basic functions; it keeps your Bank Account in order, it looks after your Home Budgeting, it calculates loan interest and repayments, and finally it checks your mortgage for you. In addition, it only lets you into the program by means of your own secret password which you personally choose. Once you've allocated budget headings, any transactions you put through the Bank Account will automatically be taken into account on your budgets.

Using a Sinclair printer, hard copy statements can be produced running from any date to any date; much more versatile than your regular bank statement! This program has been carefully crash-proofed to prevent a minor error from scrambling the existing data, and comes with clear on-screen instructions plus full printed notes to help you on your way. Finally, it holds up to 200 bank transactions and fills up most of the memory of your 48K Spectrum. **£10.00**

**Despatch within 48 Hours Guaranteed.**
**All tapes despatched by First Class Post.**

**OFFER!**

# File card

## Keep all your information on file using this excellent program from Jim Enness of Poole.

This file card program was designed to suit almost any requirements of storing useful information using a 16K ZX81. Great effort had been made to keep the programming minimal (to save memory storage space) and keep all the required functions. The program had also to be easily usable by anyone, calling for clear instructions and fool-proof entries.

The program allows up to 10K of usable storage space. You can, for example, have 100 file cards, allowing up to 100 characters per card (100 x 100 = 10,000). You may require 50 cards with 200 characters per card, or 250 cards with 40 characters. You may use any combination making up the 10K. You can also choose less than this, eg 50 cards at 150 characters if you wish; this shortens the taping out time, or taping back time, which can take up to seven minutes with a full system.

Running the program is quite straightforward. Firstly, you will be asked to give the program a name. This is used for the taping out routine and the Report Page. Still in the Setting Up mode, you will next be asked how many cards you require and your limit of maximum characters per card.

This is followed by a Section Entries mode. Each file card is broken up into sections, eg Name, Address, County, Telephone Number, etc. You will therefore be asked how many sections are required. In the above example, we would need four of course, but the cards may equally be used for Stock Number, Part Description, Price, Quantity or Song Title, Record Label, Artist, etc. The number of sections is only limited to the number of characters allowed per card, and extra sections can, of course, be added in later on in the program.

## What's in a name?

The program will then ask you to name each section one at a time. The section names as in the first example, Name, Address, etc, should be kept down to 15 characters in length. This is because these names are used as keywords for the Card Entries mode and longer names will simply get their ends chopped off after 15 characters. No harm can be done by this and you can change the section names later on should you enter a longer name. Punctuation, inverse characters and graphics may be used in these names or on the Card Entries if required.

Next comes the Card Entries mode. It is a good idea to only enter one or two cards first time around to check the system, and enter the bulk of the information later. After answering the number of cards required, the computer will ask you to input information on each section name in turn, onto Card 1. This continues until the number of cards required are completed.

Entries onto the cards is fairly straightforward – you simply enter the words or characters into the string prompt, then press Newline. This is the case with all inputs. The length of each entry is only limited to 255 characters (or the number of characters allowable on the card, should this be less). For example, if we have a section called Name and we enter 'Joe Bloggs' then this section will build up one character at a time until it is ten characters wide to accept this entry including the space. A space 10 characters wide will now be assumed on every card for the 'Name' section.

If on another card, a longer name should be entered, say 'David Appleby' then this section will expand until it reaches the end of the name. It will pad out the 'Joe Bloggs' and shorter names entered with blank spaces behind, shifting any following sections along the card so that they all line up. Each section, therefore, will assume the greatest length entry into that section for its number of characters width. It is because of this system that when entering the first long entry into a section, say an address 30 characters long, a short time (a second or two) will be taken to expand the section length. After this, entries to following cards will be fairly quick, as a shorter address will go straight in and a longer address will only expand the section by a few characters.

You could also use the system as a notebook if you want to, having 30 or so cards with 255 characters and just one section. Each card may then be used as a page containing up to eight lines (including the prompt quotes) of text.

After Card Entries, a report page tells you: Name of Program, Number of Cards, Maximum Characters (from Setting Up mode), Number of Cards/Sections used and the assumed maximum length of each section to date. Newline sends the program to the Option mode.

## On the cards

There are ten main options numbered 0–9 which may be used. Card Entries, Card Alteration, Card Delete, Section Entries and Section Name Change, do just as their titles suggest and instructions are printed up by the program for the various modes as they are used (as in all the options). Card Delete, however, will shift all the later cards forward one card thus the numbering will change leaving the spare card at the end of the file. Card List will ask for a card number and display the contents of any single card entered. List All Cards will list the name of all the sections (numbered) then list the first line's worth of characters on each card. A blank space is inserted between each section should there be several sections in the line (as may be the case in Part Numbers, etc).

Card Search will search for, and display all the cards which contain your search word/characters within a particular section. This will display the number of and the first line's worth of characters of the card. You can therefore search for a person's name to get the card number of that entry, or for a county to get names of all entries living in a particular area, etc. The search ends with a 'Finish' just in case your search is fruitless.

Section Trim will cut one character off the section specified. If you decide to abbreviate long entries to leave more room on the card, the section must be trimmed down as it has already assumed a max-

imum length that is no longer required.

Section Order Change will take the section number specified and put it as the first item on your card; the section numbering will be altered accordingly. You can therefore move the sections into any order you wish one at a time. It should be noted that in the Card Listing modes, should the information fill the screen, then Newline will clear the screen and continue the listings until the task is completed.

Slow and Fast modes are available from the Options mode, Fast is useful for listings, Slow for entries. 'T' tapes out the program, puts the recorder to record and play first, then enter 'T'. If the program tapes out before you are prepared, leave it to tape out as it will return to the Option mode after this so you can tape out as many times as you wish.

After all the options, the program will return to the Option mode. If you enter Newline alone then the program will give you back the Report Page mode. The program will not come out of this loop until it is turned off. If you wish to start a new file card program then you must press Break whilst it is busy, then RUN.

## Illegal entry

Various error messages and traps are used in the program to prevent illegal entries. If a mistake is made in the programming and an error report comes up, check and alter the program as required then enter a direct command GOTO 130. This will save any information being lost.

An alphanumeric sort of program sorts the contents of the cards from the first section, renumbering each card into alphanumeric order. This part of the program has been put in as an optional extra, although I will advise it is worth the extra work. This option should be entered after the main program has been checked and tested. Break whilst running and add in the extra program lines, then RUN. The program will stop at line 81. Lines 8 to 81 inclusive *must* now be deleted to give you back the 10K of memory for the cards. Then GOTO 1.

Sorting cards tends to be a lengthy business so it will automatically presume the Fast mode when 'S' is selected. Sorting 200 entries, 50 characters long, takes just over three minutes. Obviously, less entries take proportionally less time to sort. The search routine, by the way, in the Fast mode for 200 entries takes about 12 seconds to search and display.

## The program

Care should be taken entering this program as the memory saving techniques used make it very complex to read.

The variables I=1, Q=0, J=710, K=800, T=1000, L=2, M=7 and N=20, remain constant throughout the program and simply substitute these numbers to save memory. A$ is dimensioned 30 by 15 characters in length. This holds all the phrases that make up the instructions (the spacings should be followed to get the correct displays). A$(1) and A$(10) are left blank, A$(1) to blank the displays and A$(10) to hold the section names; the latter is updated during the program. Incidentally, this is why section names should be limited to 15 characters.

The main printing routine is the input routine at line 1000. This draws the box, top centre of screen and prints in it; this is then followed by the instructions. If extra instructions are required, the routine may start at lines 900 or 950. Most of the options use this routine and a coded message tells the routine what to print and what the input side of it can accept. H$ holds the coded message and G$ is used as the input string. For example, lines 104 to 108 ask how many cards are required, show the Setting Up mode in the box and expect a numerical answer. If the first character in H$ does not equal '0' then a number is expected. The value of this first character is the maximum acceptable; in this case 'T' = 1000 maximum cards are allowed. The second character in H$ holds the error message code for the print routine. The third character is the mode printed in the box, leaving four phrase codes to make up the instructions, ie 1 − 0 − 3 − 4 = "PLEASE ENTER" "BLANK" (twice) then "THE NUMBER OF" "CARDS REQUIRED". The value of these numbers (+ 1) are taken from A$.

## Line by line

Line 102 F$ holds the program name.
Line 108 A is the number of cards.
Line 120 B is the maximum number of characters per card.
Line 124 B$ is dimensioned and holds the cards contents.
Line 92 C$ initially holds the graphic characters of code 1.
C$ is used to hold the length of each section entry made on the card in the form of character codes, so the maximum allowable entry into any one section is restricted to 255 characters.
D$ holds the Section Names.
E$ holds the length of the Section Names (and also uses character codes).
Line 132 Prints the report page.
Line 146 GOSUB K (starts at line 800) is a more simple input G$ routine. The variable P is used as a counter in this routine. It is only used when any listings are required and is reset in the Option mode, line 164. When 22 lines have been completed GOSUB K (800) will CLS after input and add 22 to P allowing the next 22 line page to be displayed.
Lines 150−180 Print out the options and are the centre control to which all the other routines return. If a number 0 to 9 is entered then it will send the program to this number * 50 + 200. So the various options programs are numbered in steps of 50 from 200 to 650 in the same order as printed. The exceptions are the Slow/Fast, tape out, sort routine, and the Newline command for the Report Page, which can be seen from lines 170 to 180.
Lines 700 — 708 Reset E,F,G and H. The E and F variables are used to hold the number of the beginning and end characters of a particular section name.
Lines 710−714 These are repeatedly used to add up the character codes in E$ until the correct section name is put into A$(10). The G and H variables are used to interrogate the codes of C$ in the same manner to find the beginning and end position of an entry.
V, W, X, Y and Z are used as temporary variables in FOR . . . TO loops, etc, in the various routines ending in a 'don't care' state when the program returns to the Option mode.

Other variables used are:

C — Number of sections entered.
D — Number of cards used.
R — Number of unused characters left on the card.

Quite a lot of usage is made of the open ended 'TO' as in line 378. I must admit this looks strange but it is quite legal as explained in the Sinclair manual, page 137.

---

Where you see '(*space*)' leave the number of spaces indicated within the brackets. When you type in some of the other graphics characters within brackets, here is a guide to what you should see on the screen.

1Ø34  GOTO T
142Ø  SAVE F$
1422  GOTO VAL "13Ø"
```

Note that underlined instructions indicate the number of blank spaces or the graphic character symbol that should be entered in this position.

The program should now be run, tested and taped out, before continuing to add the sort option which follows. Then press Break whilst either the Option Page or the Report Page is being printed onto the screen (in Slow mode) in order to add the extra programming. Then add the following.

```
81  STOP
```

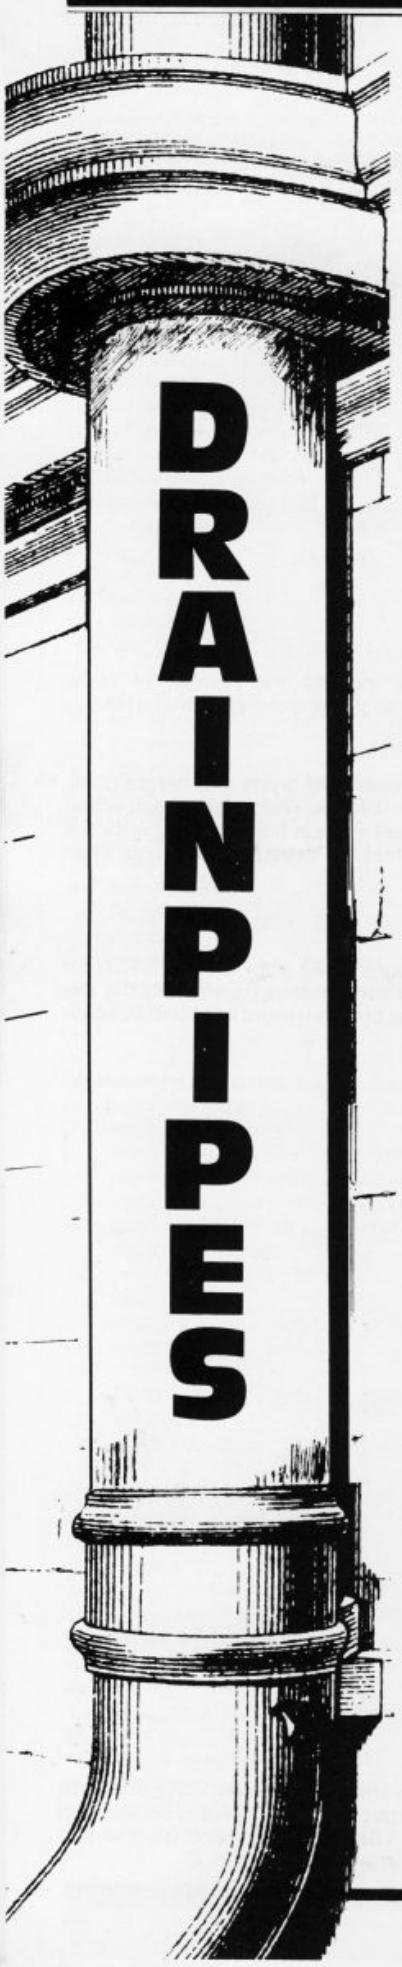
Then RUN the program. The program will stop at line 81. Now delete lines 8 to 81 inclusive (this can be done by entering the line numbers followed by Newline). The program must not be RUN again after this. Now add the following.

```
 152  PRINT "OPTIONS" (Note:- "Options" is in inverse CHR$)."(8 spaces)
      S=SORT"
 178  IF G$="S" THEN GOSUB T+L
2ØØØ  FAST
2ØØ2  FOR P=I TO D
2ØØ4  IF L**P>D THEN GOTO VAL "2ØØ8"
2ØØ6  NEXT P
2ØØ8  LET W=L**P-I
2Ø1Ø  LET W=INT (W/L)
2Ø12  IF W=Q THEN RETURN
2Ø14  LET X=D-W
2Ø16  LET Y=I
2Ø18  LET P=Y
2Ø2Ø  LET Z=P+W
2Ø22  IF B$(P)>B$(Z) THEN GOTO VAL "2Ø3Ø"
2Ø24  LET Y=Y+I
2Ø26  IF Y>X THEN GOTO VAL "2Ø1Ø"
2Ø28  GOTO VAL "2Ø18"
2Ø3Ø  LET X$=B$(P)
2Ø32  LET B$(P)=B$(Z)
2Ø34  LET B$(Z)=X$
2Ø36  LET P=P-W
2Ø38  IF P<I THEN GOTO VAL "2Ø24"
2Ø4Ø  GOTO T+L+N
```

Now enter as a direct command:

GOTO 1

then press Newline. The program should now work complete with the alphanumeric sort option. To start a new file, always Break, then GOTO 1. If you have more than 16K of memory and wish to add more cards, then replace the 'X' in line 116 with a '0'.



# Here's an adaptation of an old arcade game written for us by Colin Gooch of Somerset.

Drainpipes is based on the old style of mechanical arcade game in which steel balls were dropped into cups or tubes.

The basis of the game is simple enough. A ball runs along a stepped roofline at the top of the screen and will drop down if you press 'D'. Below it are a series of seven 'drainpipes' and you score by making it drop into the centre of one of these. Each drainpipe will only score once and a red indicator will light up to show where a score has been made. A score in each pipe will give a maximum of 28 points.

This version of the game has a random 'flip' feature. A red and white flag will sometimes illuminate as the ball is dropping and at the same time, the rate of drop slows down. If you don't like where the ball is heading press 'K' and it will slide off to the left and make its way back to the start without incrementing the ball score. You can then try again. Alternatively, as it slides off to the left you can press 'D' again whereupon it will once more go on its downward path. After 12 balls (or a maximum score!) the computer will tell you your score and invite you to play again. If you don't want to continue, then pressing 'N' will get you a fond farewell.

## Down the drain

The main movement of the ball and the setting of the graphics is done in lines 20 to 320. Lines 350 to 400 detect a scoring ball and label it with a score value. Lines 460 to 480 check to see if there is a full score line, ie that no tube still has a score of zero, and if necessary terminates the round by allowing the next loop 500 to 530 to add up the score. These lines also add the score if you run out of balls.

Lines 600 to 660 print out the score and start a new game. Llnes 670 to 690 terminate the game. The 'flip' routine is in lines 710 to 890 and shift the ball around the screen as required. Llnes 900 onward print out the game instructions.

## Variations on a theme

Anyone who wishes can find a lot of variations that can be done with this program. For a simple game, you can omit the 'flip' routine by leaving out line 190 and lines 710 to 890. You can also omit line 15 and the instructions.

Line 100 looks a little clumsy, but it works! It could be done with a subroutine of print statements. It can also be made straight . . . though whether this makes for an easier or harder game is a matter of opinion.

You can make things a little more difficult by reducing 'ra' in line 190 thus getting less flips. You could also reduce the PAUSEs in lines 730 and 800 to increase the speed of each ball.

And if you really want to get your fingers confused on the keyboard, why not write an extra subroutine called by INKEY$ "L" which will cause the ball to slide to the right. If you do this, the subroutine would be called from line 740.

NOW AVAILABLE FROM ASP SOFTWARE
See page 114 for further details

## A Graphic explanation

To help you type the program in, Colin has provided us with an explanation of some of the lines.

Line 100 includes seven Graphics shifted 8s followed by 31 spaces, then six Graphics shifted 8s followed by 31 spaces.
Line 240 includes four Graphics shifted 8s, one Graphics shifted 5, one Graphics 8, one Graphics 5, one Graphics shifted 8, one Graphics shifted 5, and so on to until the end of the line which you should finish with a Graphics 5.
Line 360 includes one Graphics shifted 8.
Line 840 includes three Graphics shifted 8s.

# HORSE RACING
## ZX81

16K. This programme analyses 17 separate inputs of information on each horse's past performance to forecast winners. The programme comments on the important factors such as the horse's racing record, weight etc. etc. Also all the information is assessed and correlated to a numerical value. Full instructions and a 14 day 50% money back guarantee if not fully satisfied. **£12.00**

1K. This smaller programme also analyses all the horses in a race and will list the most likely winners. On the first day ever trated it picked 8 winners from only 8 races (20.3.82). Full instructions included and a 14 day 50% money back guarantee if not fully satisfied. **£8.00**

## FORTUNE TELLING

The predictions in this full 16K programme will amaze you and your friends. Covers your future, day to day gambling etc. etc. A 14 day 50% money back guarantee if not fully satisfied. **£5.00**

Send cheque or P.O. to the

# Proctim

## If you're still in the dark about using your ZX81 as a process timer, Peter Coupe shows you how.

The object of this program is to enable me to use my ZX81 as a process timer in the photographic darkroom. Most photographic processes involve a number of steps and all these steps can have different times. Keeping track of which step in a process you are in the middle of, and how long it should last, makes it difficult if not impossible to do anything else at the same time as processing work. Obviously a device which keeps track of these things for you — and gives an instantly 'checkable' graphic readout — is going to make working much easier (and more foolproof!). Timers are available commercially, but many of these units will cost almost the same as a new ZX81 — and you can't play space invaders on any commercially produced timer that I know of!

The program listing is fairly straightforward and it involves no concepts beyond the scope of the average ZX81 programmer.

### RUNning the program

The program splits, basically, into three major areas:

a. Input sequence.
b. Timing sequence.
c. Graphics display.

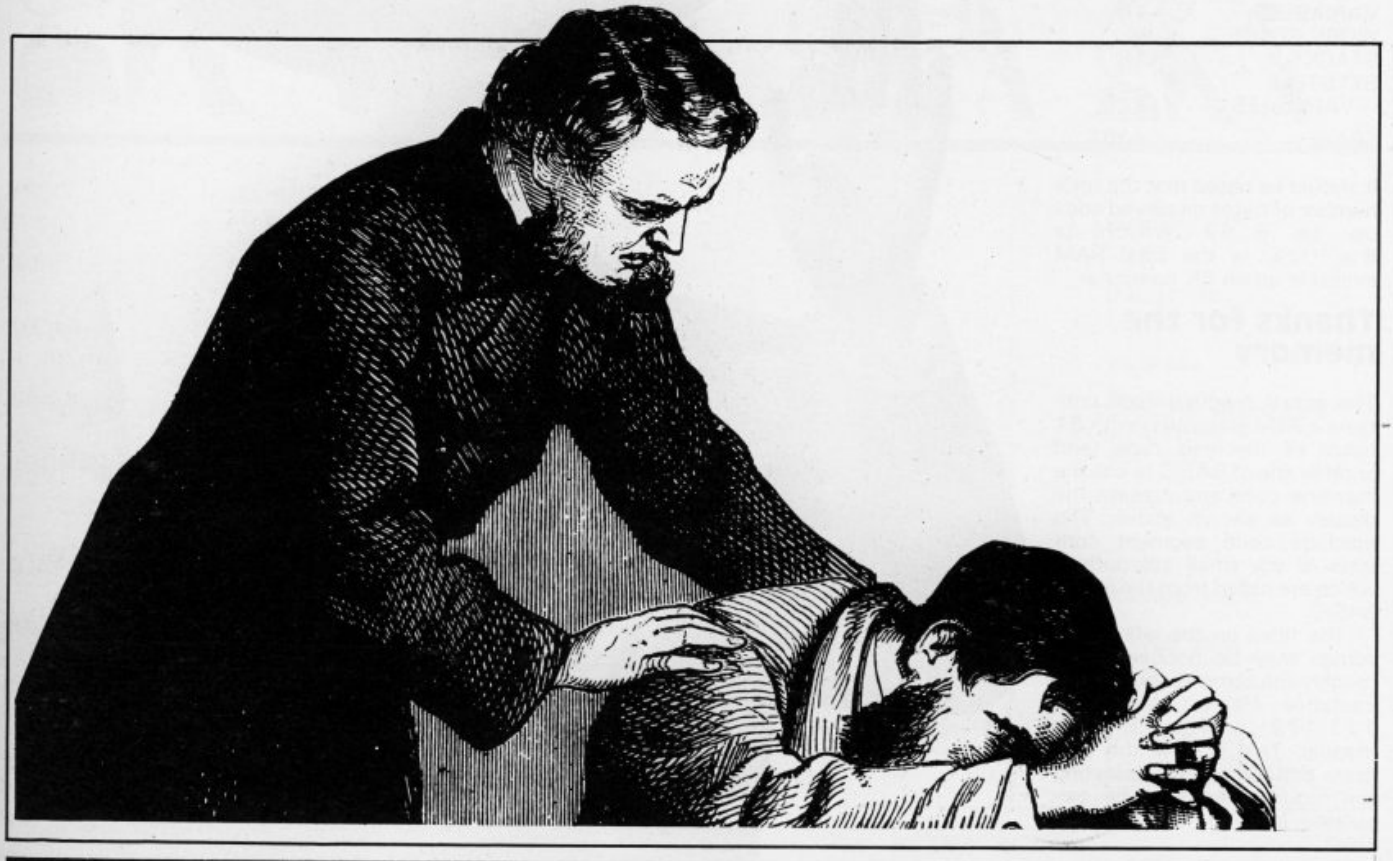
At the start of the RUN, you will be presented with the word STEPS. Here you input a number which corresponds to the number of steps in the sequence that you wish to time, between 1 and 4. Next, you will be prompted to give a name, of up to four letters, to step 1. Then, you will be asked for a time, from one minute to 10 minutes in 15 second blocks, for step 1. This sequence of naming and timing will continue until all steps are done. When all are done you will be given N/L. When you press Newline, the sequence will start.

The screen will now clear and the name of the first process and the time that you have allocated to it will appear on the top line. A vertical plot will also appear.

The vertical plot is proportional in size to the length of time that the step will take. As 15 second intervals go by, one pixel at a time is nibbled away from the original vertical plot. The bottom pixel is left to show the start of the plot. When there are only two pixels left, at the top and bottom, you are into the last 15 seconds for this particular step. At the end of the step the screen clears, a new top line appears and a new plot appears. At the end of the sequence, the word END appears.

The program runs happily in my unexpanded ZX81. Obviously, with more memory, a much more elegant program could be produced using Proctim as its base. I have found the program most useful in a number of applications in the processing of both film and paper where daylight containers are used. I suppose with the right colour filter over the VDU it could also be used in true 'darkroom' situations.

```
4     DIM Z(4)
5     DIM N$(4,4)
10    PRINT "STEPS"
20    INPUT A
30    GOSUB 500
45    PRINT "N/L"
46    INPUT F$
47    CLS
50    GOSUB 900
100   PRINT "END"
101   STOP
500   FOR K=1 TO A
510   PRINT "NAME STEP";K
520   INPUT K$
530   LET N$(K)=K$
540   PRINT "TIME FOR";
      N$(K)
720   INPUT Z
730   LET Z(K)=Z
740   NEXT K
750   RETURN
900   FOR P=1 TO A
910   PRINT N$(P);"FOR";
      Z(P);"MINS."
915   LET W=(Z(P)*4)
920   FOR R=0 TO W
930   PLOT 0,R
940   NEXT R
950   FOR Q=1 TO W
955   PAUSE 748
960   UNPLOT 0,Q
980   NEXT Q
985   CLS
990   NEXT P
999   RETURN
```



# Memory remaining

## If you've ever wondered what your computer does with all its memory, Ian Turtle has devised a useful program to tell you.

```
9999 PRINT  "MEMORY ALLOCATION",,,
            "PROGRAM", USR 16514,
            "DISPLAY FILE", USR 16522,
            "VARIABLES", USR 16531,
            "WORK SPACE", USR 16540,
            "STACKS", USR 16559,
            "SYSTEM VARS", "125",,,
            "SPARE", USR 16549
```

*The BASIC part of the listing.*

The machine code is meant to put in line 1 with a REM statement. Although the code is completely relocatable, the BASIC line (line 9999) assumes a REM statement when calling.

Should you not wish to use a Hex loader, the machine code can be loaded using the following program.

This program is a 'memory remaining/memory expanded' program with a difference. Instead of simply stating '7193 bytes used' on the screen, it splits up how the computer has used the bytes and how many bytes are remaining for future use. For example, on my 8K ROM ZX80 with 8K RAM, an output may be as follows.

MEMORY ALLOCATION

| | |
|---|---|
| PROGRAM | 2943 |
| DISPLAY FILE | 793 |
| VARIABLES | 48 |
| WORK SPACE | 0 |
| STACKS | 18 |
| SYTSTEM VARIABLES | 125 |
| SPARE | 4265 |

It should be noted that the total number of bytes displayed adds up to 8192 which is 8 * 1024, ie the total RAM available on an 8K computer.

### Thanks for the memory

The actual program itself contains a REM statement with 61 bytes of machine code, and another line of BASIC to call the machine code and present the display as shown above. The machine code segment consists of six small subroutines which are called from the line of BASIC.

The titles on the left of the screen may be noticed to be roughly the same as the system variable titles on pages 177-179 of the Sinclair manual. This is how the program actually works, selecting the required areas to be calculated from the system variables.

```
1 REM (containing 61 of any
  character)
2 FOR I = 16514 TO
  16574
3 INPUT A
4 POKE I, A
5 SCROLL
6 PRINT PEEK I,I
7 NEXT I
```

RUN this program and input the decimal values given in the machine code listing. Note any mistakes made as these must be 're-POKEd' before the end. When the last value (201) has been input, the program (if everything has been input correctly — or at least the correct number of figures have been input) will terminate with 0/7.

If found useful, the REM statement and line 9999 which calls the machine code can be SAVEd on tape and re-LOADed before inputting any program. The 'SPARE' is very useful as it give the bytes remaining at any time.

## Any RAM to spare?

If the user requires the spare RAM option without the rest, the program in Table 1 will achieve this.

| Op-codes | Hex | Decimal | Comments |
|---|---|---|---|
| LD HL,0000 | 210000 | 33,0,0 | Clear HL register pair |
| ADD HL,SP | 39 | 57 | Set HL to value of SP |
| LD BC, (STKEND) | ED4BIC40 | 237,75,28,64 | Ld BC with STKEND |
| ADD A,0 | C600 | 198,0 | Clear carry |
| SBC HL,BC | ED42 | 237,66 | Find memory left |
| LD B,H | 44 | 68 | Put valve into BC |
| LD C,L | 4D | 77 | for convenience |
| RET | C9 | 201 | Return to BASIC |

This machine code can be placed anywhere, though perhaps it would be best in a REM statement in line 1 (which will require 15 characters). Using PRINT USR (address) will print out the memory remaining.

◀ *Table 1.*

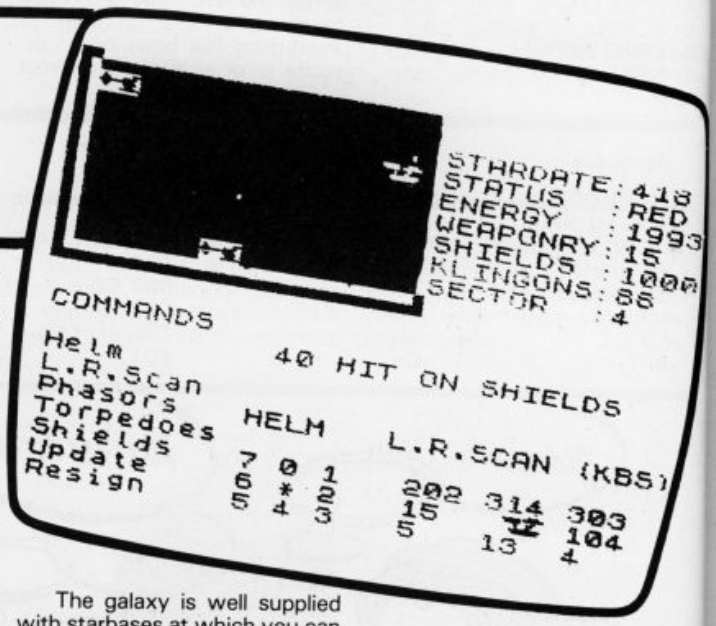
# On your Spectrum

## Phil Garratt takes a long, hard look at some of the software available for the ZX Spectrum.



### Startrek — Fuller Micro Systems

Fuller Micro Systems' Startrek is a no-frills version of the classic game, for the 16K Spectrum. Your task, as ever, is to clear the eight by eight sector galaxy of the cursed Klingons. Nicely detailed user-defined graphics are used to mark the Enterprise and any Klingons or starbases in your current sector. You are also told the state of your energy reserves, shields and torpedoes. Sectors are numbered consecutively, rather than in the more usual line/column format.

Seven commands are available in this version. 'Helm' requires a direction from 0 to 7 and 'Warp Factor' from 1 to 63, and is used for movement. 'Torpedo' uses the same direction input, and will always destroy any Klingon it hits, whereas 'Phasers' seem to need an awful lot of energy to knock out the enemy. 'Update' is equivalent to a short range display, and has to be used if you want the destroyed Klingon to disappear from the screen. Updating is done automatically when the Enterprise moves. The 'Long Range Scan' shows Klingons, starbases and stars in the surrounding eight sectors and is slightly confusing as it is not justified, so that if there are only stars in a sector, it appears in the Klingons column. 'Shields' set the strength of your defences and the last command is 'Resign' for when you tire of the chase.

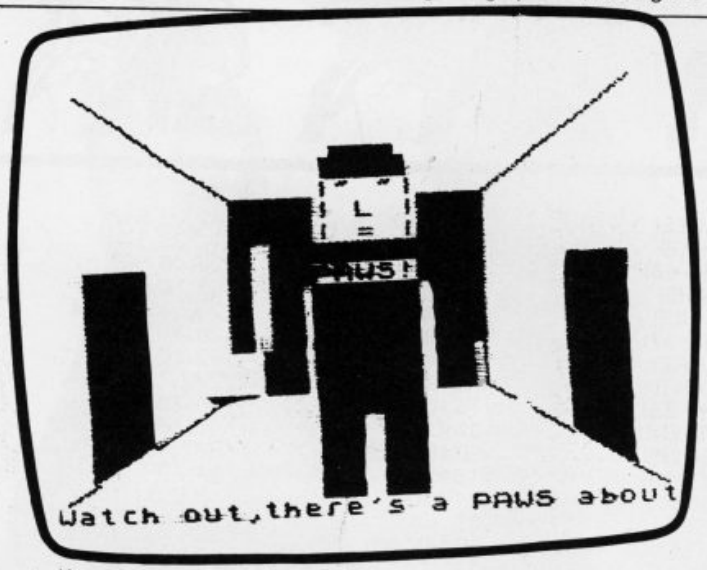
The galaxy is well supplied with starbases at which you can refuel, but I can't help feeling that with such a limited number of commands and scenarious, you'd have to be a pretty dedicated 'Trekkie' to see this one through to the bitter end. However, it is reasonably quick, has good graphics (although it would have been nice to see the torpedo tracks) and sound effects.

*'Startrek' is priced at £5.50 and is available from Fuller Micro Systems, The ZX Centre, Sweeting Street, Liverpool 2.*

### Shaken but not stirred! — Richard Shepherd Software

The 48K Spectrum rather than the cinema is the venue for the latest James Bond epic. In Richard Shepherd Software's 'Shaken but not stirred' you play the part of 007 sent on a dangerous mission to disarm a nuclear missile, which has been stolen by the dastardly Dr. Death. Having been briefed by M and after selecting your weapons from the range that Q has to offer, you set out on your adventure.

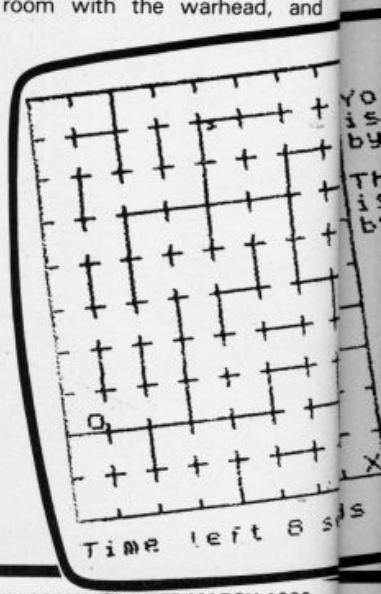
In the first stage, you must travel the world and try to stay alive long enough to gather sufficient clues to identify the island on which Dr. Death has his base. Muggers, midgets and priests are out to get you, and you will also have to cope with offers of mysterious meetings, unidentified packages and suspicious bowls of fruit. As long as you don't do it too often, you can return to London to replenish your strength and restock your personal armoury.



If you manage to find the island, you go on to the second stage in which you have to discover the entrance to Dr. Death's underwater lair. The locations on the island are logically connected (although different for each game) so you can build up a map. The sea, beach, woods and plantation all hold their own special terrors which attack without warning as you move around. If you run out of weapons with which to beat off the attentions of sharks, wolves and scorpions, then you will have to resort to brute force, which leads to a rapid reduction in strength. There is no going back to London so it is important to try and discover the secret stock of benzedrine which restores your strength. I don't remember James Bond ever taking drugs (apart from the occasional Mickey Finn!) and I'm not sure it's the sort of idea that should be incorporated in a game.

### For your eyes only

I never managed to find the lair, but if I had I would have been confronted with a 10 by 10 room maze, displayed three dimensionally on the screen. Somewhere in it is the control room with the warhead, and



also Paws, the steel fisted baddie who is too strong to fight against, and so must be avoided at all costs. Movement is by using the cursor controls, and you can also get a map of the maze, but this is displayed for just 10 seconds and can only be used *three times. If you find the control* room, you then face a mastermind-type puzzle to crack the secret code which defuses the bomb. And if you manage that then I think you deserve a vodka martini – shaken not stirred, of course!

This is the best program I've seen from Richard Shepherd, and there is certainly plenty of it. The game can be SAVEd, but once restored cannot be SAVEd again. I think it's a shame that all the graphics are left for the last section, which is very hard to reach. Little use is made of sound and rather too much use is made of the RND function for me to be hooked.

*'Shaken but not stirred' is priced £5.50 and is available from Richard Shepherd Software, Freepost, Maidenhead, Berks, SL6 5BY.*

## Football manager – Addictive Games

Versions of Addictive Games' Football manager have been produced for all the popular home micros, and it is now available for the 48K Spectrum.

You are given the managership of any one of the 64 teams in the league (you can even change any team's name to your own favourite if it is not one of those shown). Whichever team you choose, it begins in division four at the start of a new season. Your aim is to achieve promotion and a good run in the FA Cup – who knows, perhaps even win it!

The league is split into four divisions of 16 teams, so each season involves 15 league matches plus up to eight rounds of the FA Cup. You start off with a squad of 12 players and £100,000 to spend in the transfer market if you wish. If you're the sort of manager who likes to try and buy your way to the top, then you can also obtain a bank loan up to a certain credit limit based on your division, at a 1% per week rate of interest.

The players, whose names are those of current league footballers, have three attributes. First, they are either defence, midfield or attacking players. Second, they have a skill rating of 1 to 5, on which depends their value. Third, they have an energy rating of 1 to 20, which goes down by one for each game played, and up by 10 for each game rested. When you come to play a match you are given the 'team attributes' for yourself and the opposition, and it is then up to you to juggle with the composition of your team if you need to. The five team attributes are the average energy rating, morale (which goes up and down depending on results), and then the total skill rating in defence, midfield and attack.

With the team selected, you can sit back and watch the match highlights in moving 3-D graphics. This is what makes the game more than just a sophisticated 'Kingdoms'. Seven or eight goalmouth incidents are shown, with players running around, moving into position, and then shooting at goal. Having to helplessly watch the results of your decisions like this is almost as exhausting as playing. The final score is based on the team attributes, but there is always the chance of a shock result. After the highlights, if it was a league match the rest of the results are given and the league table calculated and displayed.

## Match of the day

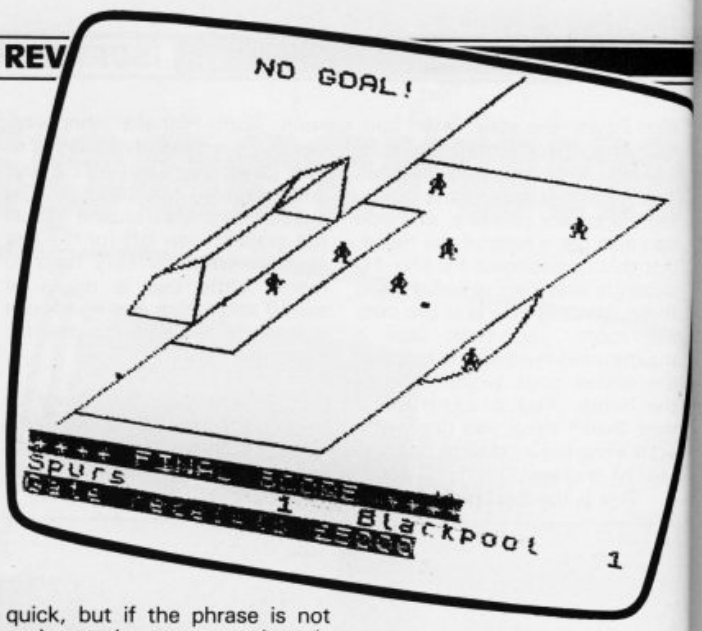
Each week you are shown your financial balance sheet. Outgoings are wages, which depend on the number of players and their value, ground rent, and interest on your loan (if any). Incomings are gate receipts, which are based on your position and your opposition's position in the league. A good FA Cup run can also be a money spinner. At the end of the season, promotion and relegation take place, you are given a bonus according to your league ▶

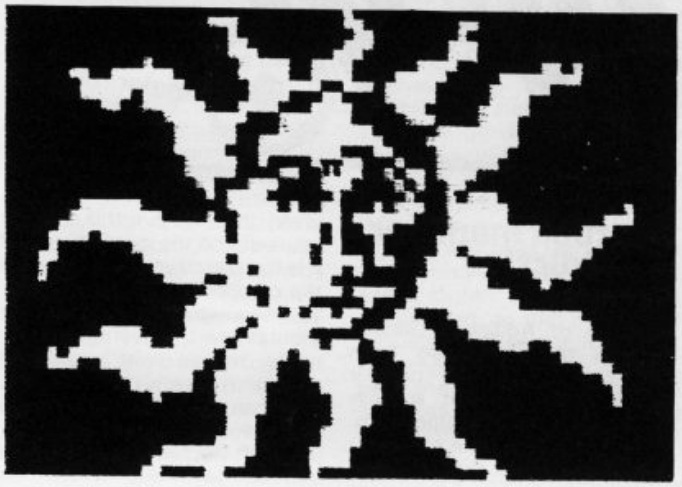
position and a 'managerial success rating' is calculated.

There is a facility to SAVE the game at any point so that you can progress with one team for as long as you like. This feature is often available in adventure or chess programs, but I always find I forget where I've been, or what strategy I was following. With Football Manager, this is not a problem, as all the information you need is available at each stage.

Although I'm no great football fan, I really enjoyed playing this game. Despite having been converted from a ZX81 program, excellent use is made of colour and user-defined graphics. The game is very logically put together, so that the development of strategy and tactics has a real effect. For example, one of my teams got through to the fourth round of the FA Cup where it was beaten by a second division side. This upset morale and meant that our promotion bid failed. Perhaps I should have given up the FA Cup run and held some good players back – the possibilities are endless. Brian Clough had better watch out!

*'Football manager' is £7.95 and is available from Addictive Games, PO Box 278, Conniburrow, Milton Keynes, MK14 7NE*





## Pimania — Automata

I thought Pimania was the reason I'm two stone overweight until I received Automania's new adventure program for the 48K Spectrum. Advertised as 'The Adventure Game that's for Real', there is more than just satisfaction awaiting the person who cracks this puzzle. If you interpret the clues correctly you can work out the time, date and place where someone will be waiting to hand over the 'Golden Sundial of Pi'. The Sundial is £6,000 worth of gold, diamond, lapis lazuli and obsidian, crafted by the award-winning designer, Barbara Tipple. The prize is on show at Southsea, and will also be displayed at computer fairs and exhibitions (accompanied by Securicor, I hope, in case anyone thinks of a less subtle method of winning it!).

The program starts in a none-too-friendly way with dire threats against anyone attempting to pirate Pimania. Then you have to work out the 'key' which unlocks the First Gate of Pi, and you get to meet the Pi Man for the first time. This all-singing, all-dancing little creature appears from time to time in the adventure, and may help or hinder your progress.

## Baked beans?

The adventure itself is not a particularly large one, around 20-30 locations, with only short descriptions. The locations are logically connected, and you move between them by entering a number, which may or may not have been suggested in the description. Objects are randomly scattered around, and a pretty odd bunch of objects they are – a cross between the 'Generation Game' conveyor belt and the adverts that come after. A cuddly toy, hula hoop, pork pie, baked beans and quite a few others are to be found, although I didn't have time to do anything very useful with them afterwards!

The program's vocabulary is described as 'absolutely vast', but if you exclude the objects and words which have no useful effect, the actual vocabulary is pretty small. The processing of words entered is reasonably quick, but if the phrase is not understood or a number is entered which is not a valid exit, the command is rejected and the location re-displayed on the screen. This makes the game rather slow to play.

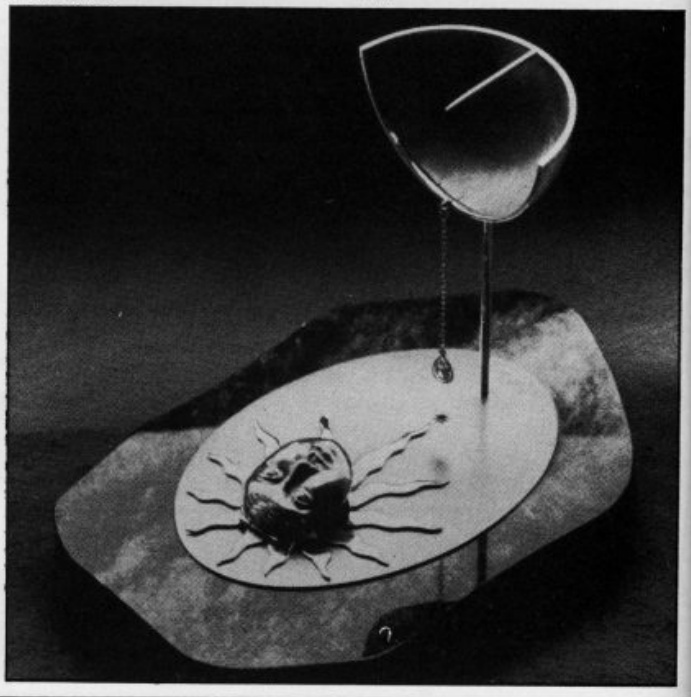
Automata are (in)famous for their ZX81 'cans of worms' programs, and despite the attempt to go more up-market with Pimania, some of the program is distinctly seedy. Rancid sewage pipes flow into clogged canals, watch out for the scab-infested odorous pit and you can guess what the sound effects are when you collect the baked beans! If frustration causes you to use language more suitable for the 'can of worms', you will be harshly punished by the Pi Man.

*'Pimania' is £10 and is available from Automata Ltd., 65A Osborne Road, Portsmouth PO5 3LR.*

## All singing, all dancing

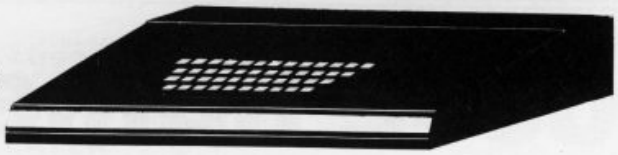
Where the program does score is in the large number of tunes and the clever use of moving user-defined graphics. The tunes range from the 'Hokey Cokey' complete with dancing Pi Man, to a gratingly not-quite-right rendering of 'Lucy in the Sky with Diamonds' when you collect the valium!

I didn't have sufficient time to work out how the objects relate to each other or to the locations, so I haven't any idea what the solution is or what form it might take. But with so many objects, tunes, locations and graphics, some or all of which may provide clues to the treasure, there's certainly many hours of detective work to put in.



# COBRA 1000

## THE COMPLETE BUSINESS SYSTEM FOR THE ZX81



The Cobra computer system allows you to expand your Sinclair ZX81 into a powerful and efficient computer for the small business.

- Accommodates a full range of business hardware
- Capacity for up to 9-12 boards
- PCB slide guide systems ensure total stability
- All add-on hardware comes complete with leads and sockets — no soldering of drilling necessary
- Durable, lightweight metal computer case
- Fully professional keyboard — with space bar

### HIGH QUALITY, FULLY BUILT BASIC MODEL £79.95 + VAT

Expand your Cobra with a comprehensive choice of add-ons:

• Interfaces • Tape drive unit • Upper and lower case character board • High resolution graphics • Input/output ports • Light pen • Colour Modulator.

### THE CHEAPEST INTERFACES ON THE MARKET

**RS 232 Interface**

At last a high quality 232C interface to allow you to connect your ZX81 to any 232C printer from the cheapest dot matrix to the most expensive daisy wheel. Look at these features:

- Baud rate variable from 110 to 9600 with software control
- Upper and lower case printout
- Up to 120 haracters per line
- Small and compact — fits on to the back of your ZX like a RAM pack
- Uses the ZX power supply
- Output via a small 3 pin jack.

**Price only £26 + VAT**

**Centronics Interface**

Allows you to connect the ZX to any Centronics printer. Has similar features to the 232C interface — one exception is that output is via a 24 way socket at the back of the unit.

**Price only £26 + VAT**

**Coming Soon: ZX81 SPECTRUM MICRODRIVE INTERFACE**

Connect the Sinclair to the new Spectrum Microdrive! As soon as the microdrive is available we will be developing an interface for it to be connected to your ZX.

Interfaces will also be available to adapt this example of modern micro engineering for use with Apple and Pet computers.

This is just one of the future developments by Cobta Technology.

### MICROLINE A PRINTER

• Print speed 120 characters per second • Bidirectional printing • 9 x 7 dot matrix • 5-10 and 6.5 characters per inch • 8 or 10 lines per inch • Vertical tabulation and form feed • Form length user selectable • Upper and lower case • Block graphics • 1 line print buffer • 80 characters per line

**Price £281.75 inclusive of VAT**

# House names

## Should you have a problem searching for a house with a name but no number, Mr Graham of County Durham has come up with a clever solution.

This program, written for the ZX81 with 16K RAM Pack, following initial entry will start immediately with a main menu. This menu offers you seven options: a list of house names; a search for a house name; a display of a street; the opportunity to enter or amend a house name; to start a new file; to save a file on tape; or to finish.

Ten maps of 20 lines can be entered line by line and after 10 lines have been entered you are asked if you would like to correct any errors. If you make an error at this stage there is no need to worry as you can always amend your entries later using option 4.

House Names will search for a property using the first few letters of the name and then display a map on the screen with a flashing cursor in inverse video adjacent to the house in question. On request, the computer will then search for another property. Once you have the correct display on screen, you can copy the screen onto a printer.

Save and finish routines are included in the listing. For a more detailed guide to the listing, here is a table of the variables used in the program.

| | | |
|---|---|---|
| B | – | Map screen number. |
| C | – | Map line number. |
| D | – | Flag check. |
| E | – | Loop counter. |
| F | – | Loop counter. |
| G | – | Flashing cursor line number. |
| H | – | Flashing cursor loop counter. |
| S | – | Save flag check. |
| X | – | Temporary map screen number. |
| M$ | – | Map string. |
| N$ | – | Name string. |
| P$ | – | Temporary test. |
| T$ | – | Test string. |
| X$ | – | Input check. |
| Z$ | – | Input. |

The reason why so many variables were used was to protect the screen maps. Should the program crash, try typing GOTO MENU and restart from there.

The final example shows a street with the various houses with their names PRINTed alongside.*

# The prize of your dreams

## Our reviewer, James Walsh, looks at the latest offering from Artic Computing and tries to win himself £10,000.

KRAKIT is a new program from Artic Computing which claims to be the ultimate adventure for the Spectrum/ZX81 with the added bonus of a generous prize if you should be the first to 'KRAKIT'. Retailing at £9.95 in this country, it certainly isn't cheap — but is it worth the cash? There is only one way to find out — cassette in, LOAD "RULES", press Play, sit back and wait.

Because of the complexity of the program, the rules and clues have been split up into two separate programs on the 16K ZX81 and ZX Spectrum. So, while we are waiting for the program to LOAD, I'll tell you something about the package itself.

### The story so far...

The story is that your eccentric father has left you £10,000 in his will, but (and it is a big but) to claim the money, you must first solve 12 clues before you can gain access to the bank account in which the money has been placed. The prize money actually exists and just to make things completely fair, Artic Computing have released the program simultaneously in America to run on the Timex 1000. Artic are quite definitely going all the way to make it successful and fun — not only has there been a lot of press on the package, but Artic have set up a 24 hour telephone answer line so that contestants can keep themselves informed about the status of the contest and the amount of prize money now available (if the prize is not claimed the amount of money is increased on a weekly basis).

OK, it looks as though it has almost LOADed. Hurrying to get my registration form so that I can quickly claim my prize, I sit down waiting for the program to begin. You are first greeted with a menu which offers you five options: how to register, rules and play, see a sample clue, how to claim the prize and see the real clues.

### All clued up?

The rules program is good. There is a nice sequence of graphics to start — a key moves across the screen and turns in a lock. After reading the rules, I pressed for option 3 and had a glance at the sample clue. After the solution has been explained to you, you are ready (?) to start on the real clues...which I did. So, LOADing the clues program, after a couple of moments (in ZX time, of course) up comes the title page:

WELCOME TO KRAKIT, THE ULTIMATE ADVENTURE

This certainly looks promising!

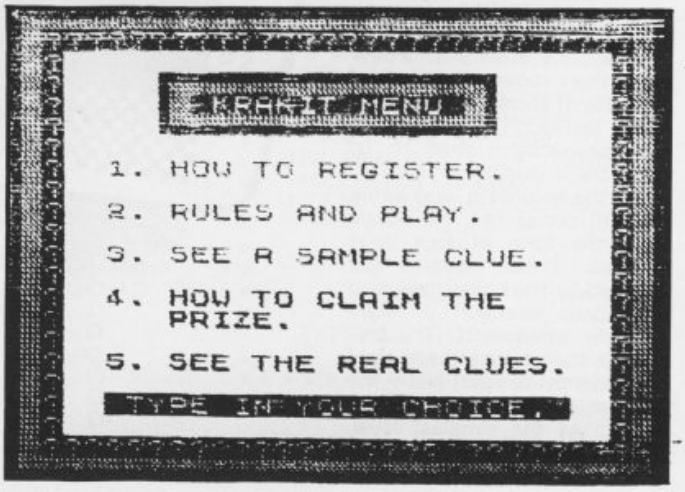
Then it's down to the real work of this program — the clues themselves. Their difficulty ranges from moderately difficult to downright impossible, but they are not all along the same lines as is so often the case with games.

Now for the one disappointment of the program — there are no graphics at all. Surely they could have 'jazzed' up the clues a little with some animated diagrams or moving pieces. That might sound a little silly, but it would be nice and would certainly brighten up the game. As it is the program has been written almost entirely in BASIC, which seems rather wasteful of space and time, though fortunately (as you will soon find out) the time factor is not so important!

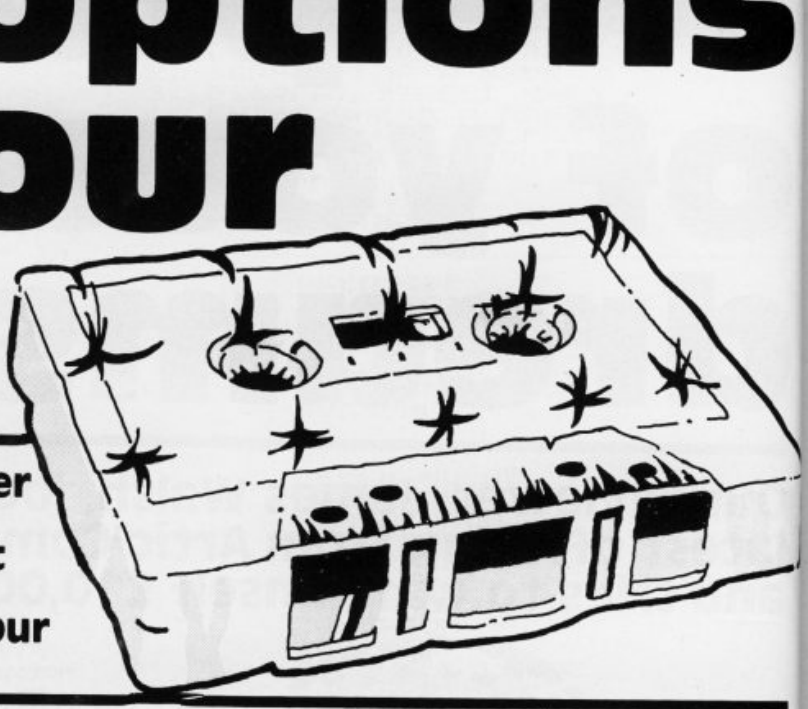
Actually playing the game is quite fun, but I fail to see the need to take the trouble to put on a cassette and load it all in and spend hours staring at a TV screen, when it could quite easily have been written out on a few pieces of A4 paper and sold for a tenth of the price.

As for the game itself, it is definitely good if you are into cryptic clues and mind-bending puzzles, but I would not say it was for the majority of games players. Needless to say, I have not filled in my registration form yet!

KRAKIT is priced at £9.95 and is available from Artic Computing Ltd, 396 James Reckill Avenue, Hull, North Humberside HU8 0JA.



# Soft options for your ZX81



**Puzzled by Dr. Nowotnik, after a glass of wine Nick Pearce settles down to checking out some of the software commercially available for your ZX81.**

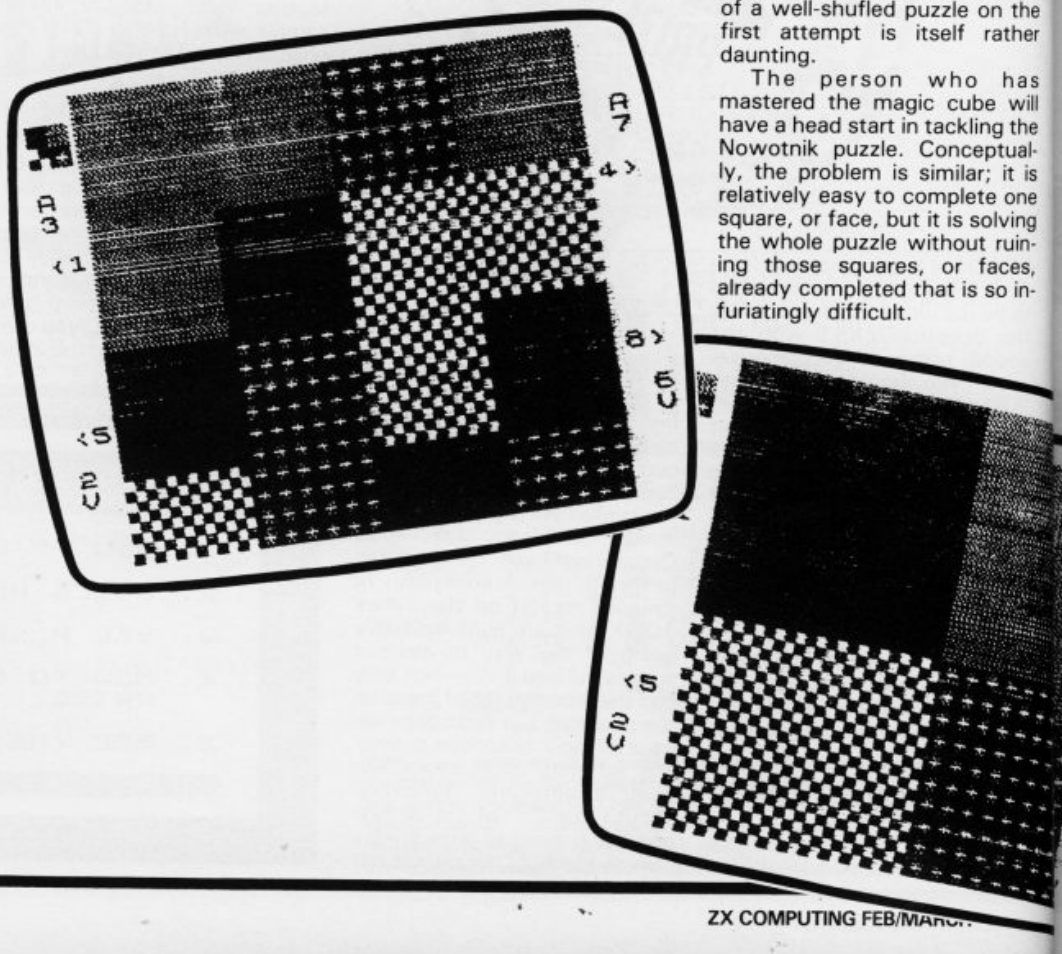
## The Nowotnik puzzle and Other Diversions — Phipps Associates

If you're bored with that dratted Rubik cube, then the Nowotnik puzzle is an original concept in computer games that might be just the thing for you. The chances are you'll be tearing out your hair in handfulls trying to solve the puzzle at the simplest level of play, knowing that there are four progressively harder levels to move onto if you ever do manage to get it worked out. "Easy — it's only two dimensional", I hear you say, as I myself commented — until, that is, I had seen the pieces shuffled and attempted a few exploratory moves. It is indeed a puzzle of merely two dimensions, but don't be under the misapprehension that it is, therefore, a doddle.

At the beginning, and when (and if!) completed, the puzzle is in the form of four large squares. These squares are shuffled by the computer using a random selection of eight possible movements. The problem is then to use these eight movements to get back the four squares in their original layout. At the simplest level, each of the four large squares is broken up into four by the shuffle, giving sixteen smaller squares; at the hardest level, the four squares are each divided into 144 elements, giving a total of 576 elements altogether!

If you complete the puzzle, you are told the number of moves taken, and there is a game save facility so that a partly completed puzzle can be continued, and hopefully finished, later. I would have liked an option to reduce the number of shuffles so that some logical method of solution could be developed by trial and error during the first few tries; the sight of a well-shufled puzzle on the first attempt is itself rather daunting.

The person who has mastered the magic cube will have a head start in tackling the Nowotnik puzzle. Conceptually, the problem is similar; it is relatively easy to complete one square, or face, but it is solving the whole puzzle without ruining those squares, or faces, already completed that is so infuriatingly difficult.



A very addictive game, and as is so often the case with this kind of competition of self versus the computer, it is very hard to admit defeat and one tends to persist, thinking that a few more moves will have it cracked. Perhaps it is fortunate that the ZX81 is less portable than the cube, otherwise it would undoubtedly make its appearance at parties with the nonchalant admission, by devotees, of the number of moves or time taken to solve the puzzle.

## A dynamic duo

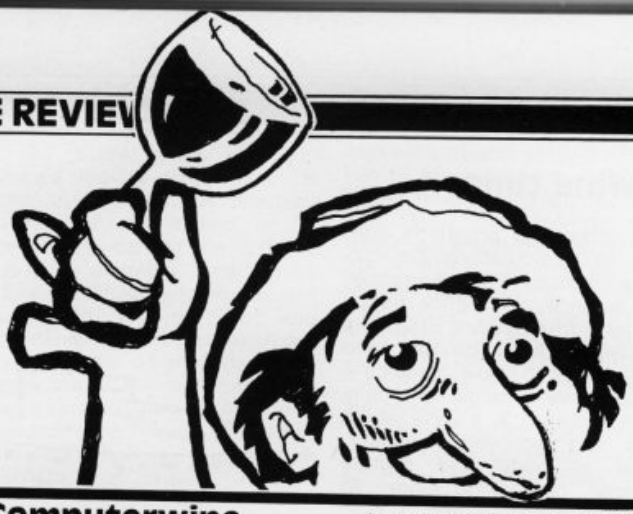
Two other games, routine in comparison to the puzzle but nonetheless absorbing, complete this cassette and make it good value for money.

In Demolition, a wall appears at the bottom of the screen and the object is to knock down as many bricks as possible using a '*' fired repeatedly at the wall. There is a catch — the wall moves upwards at a slightly faster rate than you can knock bricks out, and also more walls appear; eventually the game ends when a wall reaches the top of the screen. Points are awarded for each brick removed, and the total for the game is displayed so that a competition between a number of players can be held. A fast moving interactive game and completely idiot proof — my four year old daughter played for about an hour without managing to crash the program!

Finally, Tenpin simulates a standard game of tenpin bowling. The alley is displayed at the top of the screen, with score cards for either one or two players displayed below. The game is played over ten frames. When bowling, you indicate the strength of delivery; a stronger delivery is less accurate but increases the number of pins which fall if you make a hit. Not being a tenpin bowling afficionado, I was intrigued by the scoring which apparently is true to life and is coupled with 'strikes' and 'spares'. The graphics are fair; the ball disappears when it hits the pins and the effect as the pins fall and also disappear is rather disconcerting. Nonetheless, a novel simulation to complete the package.

All the games on this cassette require a ZX81 with more than 1K, and each program is duplicated on the reverse side. The programs can all be LISTed, and instructions for making security copies are given. Dr. David Nowotnik, the author of the three programs, is a member of the Aylesbury Computer Club.

*'The Nowotnik puzzle and Other Diversions' costs £5.00 and is available from Phipps Associates, Mail Order Dept., 99 East Street, Epsom, Surrey.*



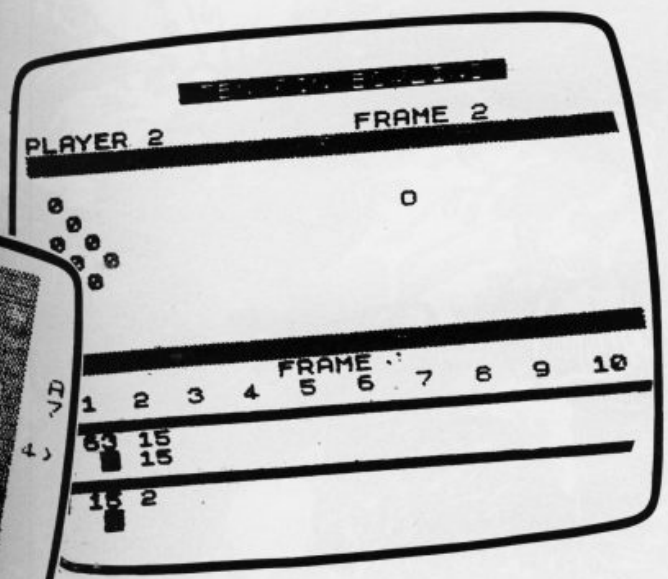
## Computerwine — Computerwine

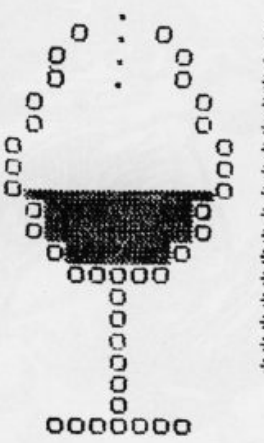
If you make your own fruit wines, you might find this package of interest. It is aimed primarily at the more experienced winemaker, and is a tool to enable precisely balanced wine recipes to be designed quickly and accurately. For the amateur, it shows that there can be more to making wine than religiously following recipe books — perhaps leading to the development of winemaking skills.

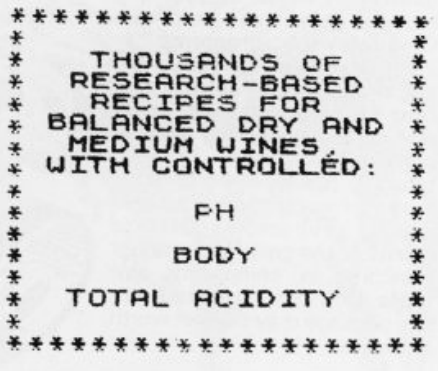
The package is based on the results of recent and apparently extensive research which has led to the discovery of some of the scientific principles which govern the balance of wines. It is now possible to select through these principles the ingredients of the must to give a wine of the required acidity, body and alcohol content. Flavour is not scientifically defined but is left up to the winemaker through the choice of a large selection/combination of fruits — although hints for achieving a wine of good flavour are given. The computer programs cover the design of balanced wine recipes for dry and medium wines (Computawine intend to make programs available for sweet and dessert wines soon).

Instructions come in a 22 page manual, which is well written and extremely helpful — a pleasant change, I feel; so often, otherwise good computer software is let down by the poor quality of the supporting documentation. As well as describing the background to the experimental work, together with the theory behind a 'balanced' wine and giving a comprehensive explanation of the program, it also gives some useful practical hints on successful LOADing and the merits of various cassette recorders and makes of cassette. It gives a lot of useful information of a more general nature to help the winemaker, although probably not sufficient to instruct a complete beginner in the art of winemaking.

Five separate programs are recorded on the cassette, and each is duplicated on the reverse side. Firstly, there is the Preface; this takes three minutes to LOAD and runs automatically, starting with some nice graphics. It then displays a summary of a few of the more important points given in the manual. A nice touch (although I feel it is largely unnecessary) is that the manual itself is sufficiently comprehensive and gives full instructions as well as examples.



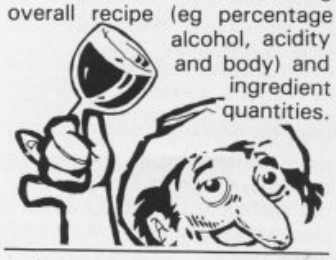




## A wine time

The other four programs contain the calculations for the wine balances. The selection of the balance, and hence which of these four balance programs to use, depends on the wine one wishes to make. Balance 4 should give a quick, dry table wine; balance 3, a wine which is a little improved in quality, fuller in body and slightly sharper, but taking longer to make; balance 2 and 1 give wines of fuller body and more flavour. Each of these programs takes about six minutes to load.

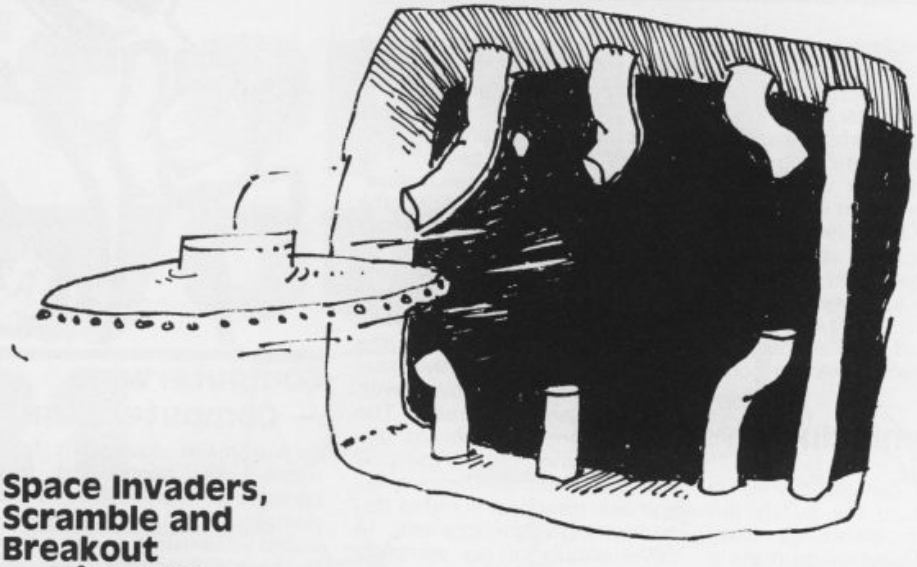
These programs are used to create wine recipes by specifying (from a list given in the manual) which of the two-ingredient sub-recipes are to be used (up to eleven can be combined), and the proportion of each. The programs go on to give data on the resulting overall recipe (eg percentage alcohol, acidity and body) and ingredient quantities.



In summary, a novel application for the ZX81 and a very well-produced package in all respects. The programs are easy to use, my only criticism being the time taken to LOAD which might tend to put off the casual winemaker; and one really does need a cassette recorder with a digitiser, or fast forward/cue facility, to be able to locate quickly the desired balance program. One could overcome this, of course, by SAVEing each balance on a separate cassette — instructions for SAVEing the programs are given.

I cannot comment on the quality of wines made using recipes developed from the Computawine programs — you'll have to wait a year or so, I'm afraid, to find out the success of my efforts! Both wine making and computing are time consuming hobbies, and one tends to preclude the other — too much wine and the humble ZX81 keyboard starts to resemble the cockpit display of Concorde in complexity. For those who can combine both, this package may be well worth looking at.

*'Computawine' costs £7.95, and is available only from Computawine, 9 Laburnum Way, Etwall, Derby.*



## Space Invaders, Scramble and Breakout — Microgen

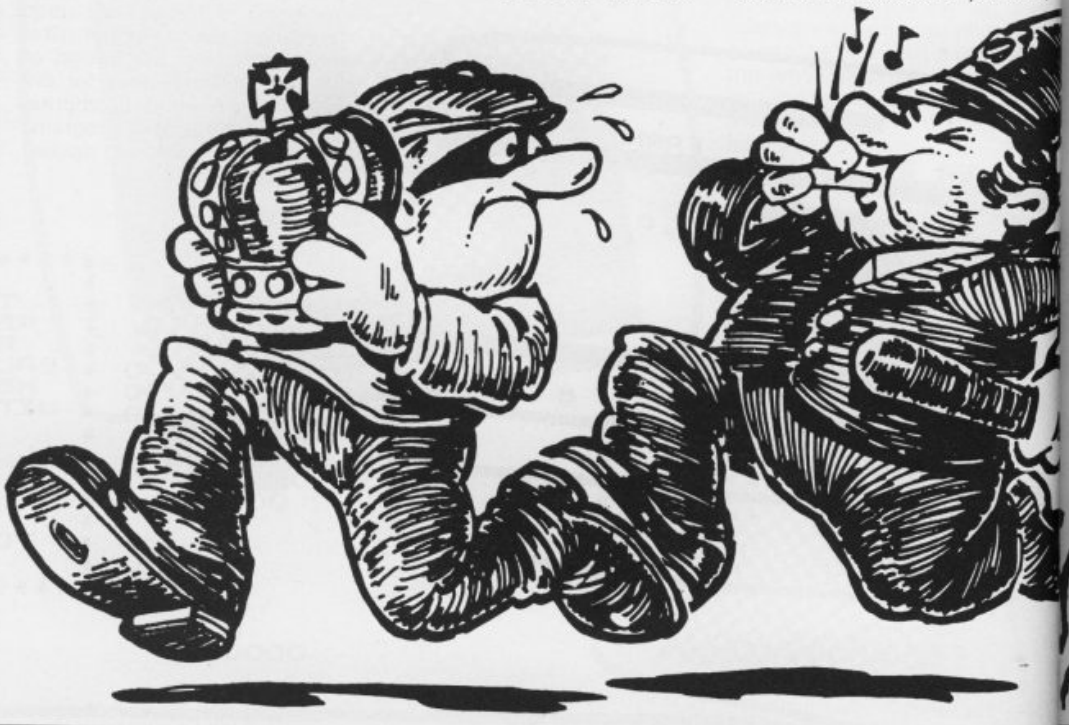
Space Invaders is Microgen's version of the arcade type game of the same name in which you defend the Earth from successive armies of invaders. On LOADing the program, you are presented with a choice of three speeds (normal, fast and superfast). The invaders are displayed at the start of the game and there is a short pause before the action starts to allow you to prepare yourself. You have three lives (bases), and lose one each time a bomb from the invader fleet lands on you, or if you allow any invader ship to get down to the level of your shields. The technique is to knock out the lower ships first with your laser beam.

Ten points are awarded for each invader ship hit, and if you clear the first wave, another will take its place, and another . . . Each time this occurs the game speed is increased slightly. The game performed well and I found it enjoyable without being positively addictive. However, I thought the action was somewhat jerky, particularly at the slowest speed. I was told by an experienced player who had a go that it bears the most similarity to the arcade game when it is played in the superfast mode — too fast for me!

The program includes the option to use Microgen's joysticks, which I think would make a significant improvement over the use of the touch sensitive keyboard for interactive games of this sort. A nice finishing touch is the display at the end of each game giving the score for that game and the highest score so far, thus enabling competitions to be played.

This game is also marketed by Sinclair under the Psion label with Bomber, also by Microgen, on the reverse side.

Scramble is another fast interactive arcade type game. In this one, you are flying low over mountainous enemy terrain, the object being to keep your ship in the air for as long as possible. At the same time, you have to shoot down as many of the alien attackers as you can,



and there are air-to-air and ground based missiles to contend with as well. Points are awarded for each alien and air-to-air or ground missile you hit.

Your fleet is small — three ships — and only one is in the air at a time, although you can get a bonus ship if your score reaches five thousand points. Fortunately, you carry an unlimited supply of ammunition plus one 'smart' bomb in each ship which will destroy everything in sight. The nearer you get to the enemy base, the more frenetic become the alien attacks on your ship.

Again, joysticks can be used and would be a definite advantage with this game. It is particularly difficult with the touch sensitive keyboard of the ZX81 to both maintain and achieve forward and up and down movement as well as battling with the aliens. As with Space Invaders, the most recent game score and 'highest so far' score are displayed to facilitate competitions.

## Another brick...

Finally, from Microgen, Breakout is the traditional 'ping pong' video game. Again you have a choice of three speeds (normal, fast and superfast) and three lives per game. You score ten points for each brick removed from the wall, and after each hit, the speed of the ball increases slightly. There are seven angles of rebound off the bat, and one life is lost each time the ball misses the bat. You win one thousand points for completely clearing the wall (not much chance of that with yours truly at the controls, but with practice and at the slowest speed, who knows...), and a record of the highest score is kept. A well-written and enjoyable version on this not terribly inspiring theme.

All these three Microgen games require more than 1K and are written in machine code. They are 'locked', ie the programs cannot be LISTed and, for example, modified by the user. They perform well, are enjoyable, and are idiot and crash proof. However, with only one game on each cassette, they are in my opinion rather overpriced. There is only one recording on each cassette, although the review copies all LOADed first time.

*'Space Invaders', 'Scramble' and 'Breakout' cost £3.95 each and are available from Microgen, 24 Agar Crescent, Bracknell, Berkshire.*

## Gamestape 6, Breakout — J. K. Greye

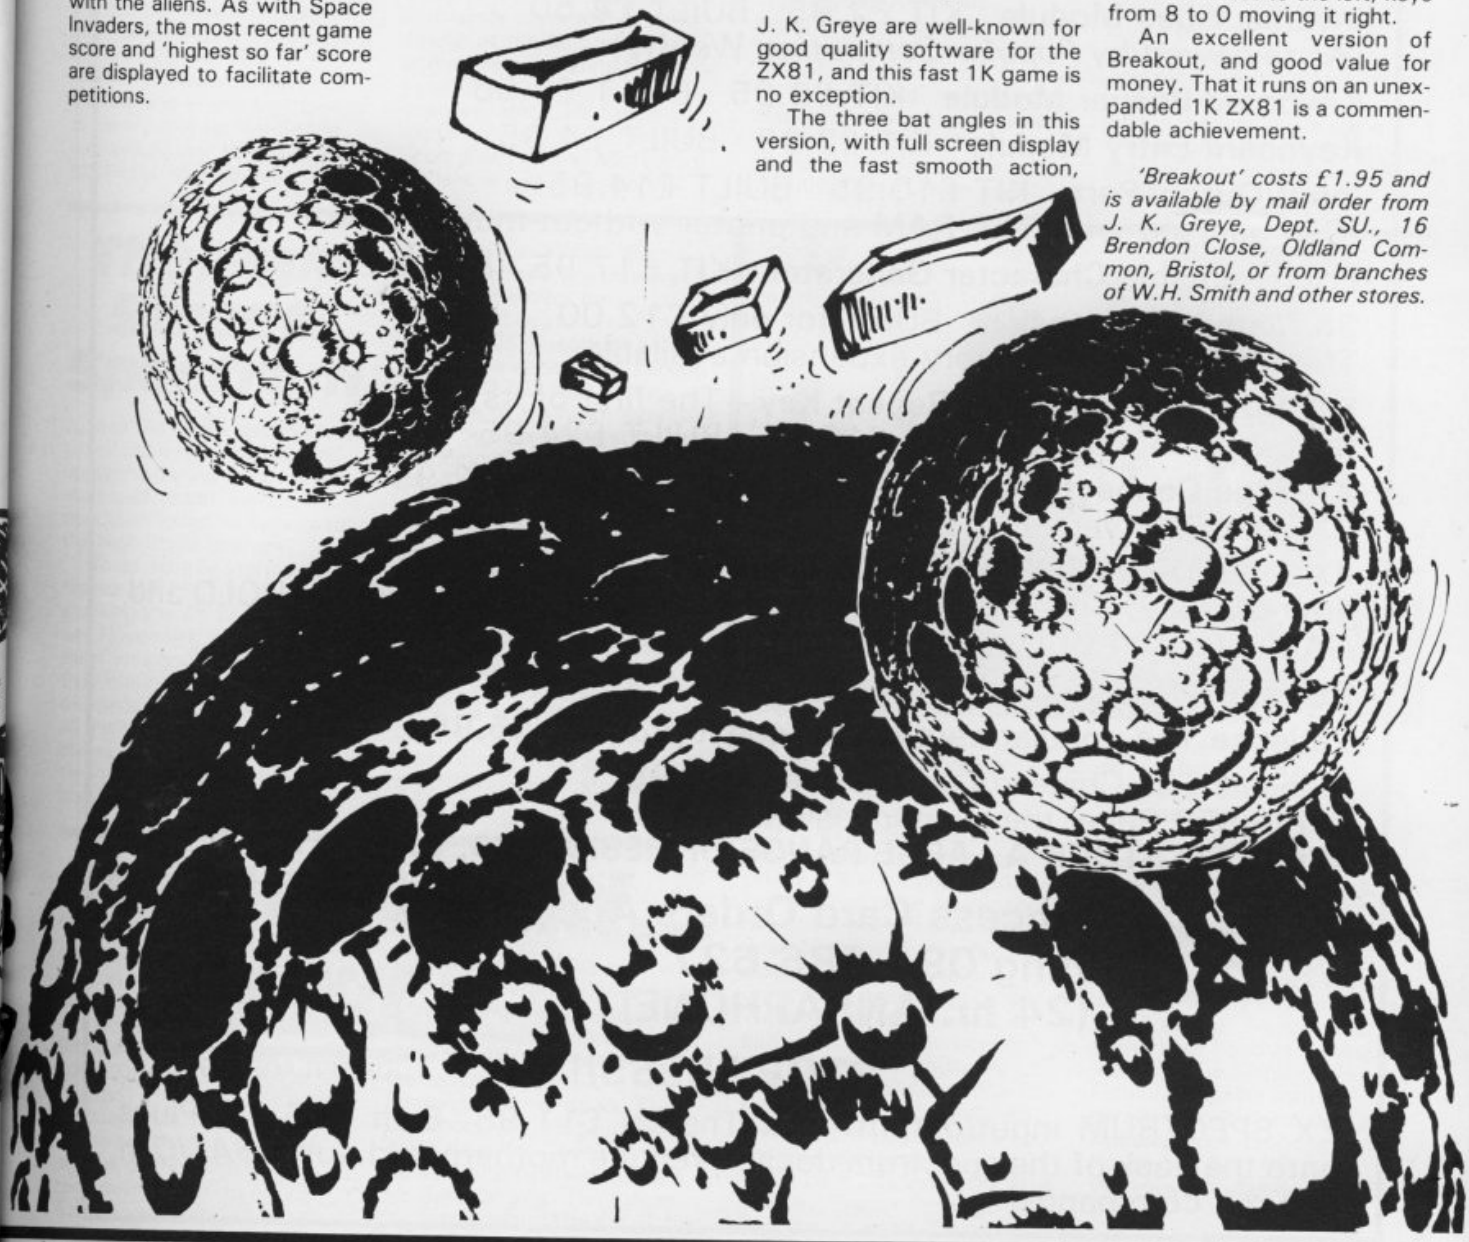
J. K. Greye are well-known for good quality software for the ZX81, and this fast 1K game is no exception.

The three bat angles in this version, with full screen display and the fast smooth action, make it a treat to play. It is written in machine code, and the speed (choice of fast, medium and slow), and the bat size (large or small) can be varied using POKE commands. Although written in 1K, this game can also be played on a ZX81 with 16K RAM pack (by POKEing RAMTOP *before* LOADing the program — full instructions are given).

Nothing as straightforward as the usual Breakout wall of bricks on this one either. The wall is built up of pound signs which convert to dollars when hit. Ten balls are available and a maximum score of $240 can be achieved (but not by me!). The instructions state that bat movement is effected by using the cursor keys 5 to 8; on the review copy, however, any key in the top row from 1 to 5 moved the bat to the left, keys from 8 to 0 moving it right.

An excellent version of Breakout, and good value for money. That it runs on an unexpanded 1K ZX81 is a commendable achievement.

*'Breakout' costs £1.95 and is available by mail order from J. K. Greye, Dept. SU., 16 Brendon Close, Oldland Common, Bristol, or from branches of W.H. Smith and other stores.*



# HAVEN HARDWARE
# ZX PRODUCTS & JUPITER ACE

SAE for details. 4 Asby Road, Asby, Workington, Cumbria CA14 4RR.
Prices include VAT and P & P.
Some of the products are also available from the following agents:
THE BUFFER SHOP, 374A STREATHAM HIGH ROAD, LONDON SW16
MICROWARE, 5 ST PETER'S LANE, LEICESTER.
PHILLIP COPLEY HI-FI, 7 CLIFFARD COURT, OSSETT, WEST YORKSHIRE.

## TRADE ENQUIRIES WELCOME

### ZX80 & ZX81 HARDWARE

**Repeating Key Module** KIT £3.95 BUILT £5.95
(As reviewed by *Popular Computing Weekly*)

**Inverse Video Module** KIT £2.95 BUILT £4.50
(As reviewed by *Popular Computing Weekly*)

**Keyboard Beeper Module** KIT £6.95 BUILT £8.50

**Keyboard Entry Module** KIT £2.95 BUILT £4.95

**Input/Output Port** KIT £10.95 BUILT £14.95
(Can be used with 16K RAM and printer without motherboard)

**Programmable Character Generator** KIT £17.95 BUILT £24.95

**3K Memory Expansion** BUILT for only £12.00
The most reliable memory expansion available.

**Full-Size Keyboard with Repeat Key**—The first of its kind
Built version plugs in. KIT £19.95 BUILT £24.95

**ZX Edge Connector** 23-Way Long gold plated pins £2.95
ZX Spectrum version £3.50

### ZX SPECTRUM SOFTWARE CASSETTES

**Fruit Machine** Colour graphic representations of fruits. Including HOLD and GAMBLE. £4.95

**Solitaire** Alpha-Numeric move entry. £4.95

**Patience** The popular card game (cheat proof). £5.95

**Mancala** The Chinese Logic Game. £5.95

**REPULSER** Repel the alien invasion. £4.95

**WE ALSO STOCK A LARGE RANGE OF RESISTORS, CAPACITORS, ETC**

**Access Card Orders Accepted**
**Ring 094 686 627**
**(24 hr. ANSAPHONE)**

JUPITER ACE £89.95

## STOP PRESS!!

ZX SPECTRUM input/output port. The kit £11.95. Built £15.95. Plugs onto the back of the spectrum doesn't require motherboard. (uses *BASIC* in and out commands).

# What's in store for '83?

At a recent press conference, Nigel Searle of Sinclair Research was asked many of the questions which have been on everyone's lips over the last few months.

The Microdrives were, of course, one of the first topics to be brought up. Mr Searle announced that he expected to see the Microdrives released in the first quarter of 1983. As to why there was a delay in their introduction, journalists were told that the design of the Microdrive was altered at a late date to incorporate some improvements. Mr Searle explained why no details had been given on the Microdrive, "There is just no reason to give them (our competitors) three or four months lead time. We expect the Microdrives to improve the sales of the Spectrum, but I would expect the Spectrum to sell on its own anyway." Mr Searle went to explain that the Microdrives will be using "a totally new material for the recording medium. It's not been used before in computers."

Talking about Sinclair Research's sales abroad, Mr Searle had this to say about their growth in the Japanese computer market. "We've not made anything like the impact on the Japanese market we would have hoped, but we will be tackling it. The realistic alternative is to do it on one's own. It's a difficult job to do, but it's a challenge. If we took that approach, we would open an office in Japan, but as a matter of choice we would not manufacture in Japan."

Moving onto the subject of the competition, which seems to have made itself more obvious over the last few months, Nigel Searle had some fairly cryptic comments to make. When asked if the price of any of their products would be coming down due to the introduction of products such as the Oric, he replied "If they knew what Sinclair were going to do, they might well have cut their prices." And on Binatone, Nigel Searle really set the cat among the pigeons with these comments — "I think we will worry about that (the Binatone computer) when they release the machine. If we really believed the rumours we've heard, we would have released the ZX83 two months ago."

Nigel Searle shouldn't have been surprised at the avalanche of questions resulting from his throwaway comment. Hedging a little on the 'ZX83', Nigel Searle had this to say, "We are going to try to produce a machine which is quite different from any other on the market. We want to create a new segment of the market — it's not a matter of moving up or down the personal computer market."

# The High Street Spectrum

Just as the ZX81 began life as a mail order item only to end up as the darling of the chain stores, so to has the ZX Spectrum found its way onto the High Street shelves.

To an astonishingly quiet fanfare, WH Smiths began stocking the ZX Spectrum in late November, 1982. And there was good reason for their silence — the first batch of Spectrums delivered to 66 of the larger WH Smiths stores were sold out within two to three hours! However, now stocks of the Spectrum are widely available, WH Smiths are proudly beating their chests over their computer coup.

The 16K Spectrum will sell at £125 and the 48K version will be £175, both prices inclusive of VAT. An extensive range of compatible software, including WH Smiths' own-brand range, is now available in the larger branches together with a new WH Smith Computer Carry Console at £14.95. A comprehensive range of computer books and magazines is also available in the stores' 'Computer Know-How' departments.

You should be able to purchase a ZX Spectrum, and accompanying software and publications, from any of the larger WH Smiths stores in England.

# Better read...

Hilda Bernstein, the South African womens' and black rights' campaigner, has won the first annual £5,000 Sinclair Prize for Fiction for her novel, Death is Part of the Process.

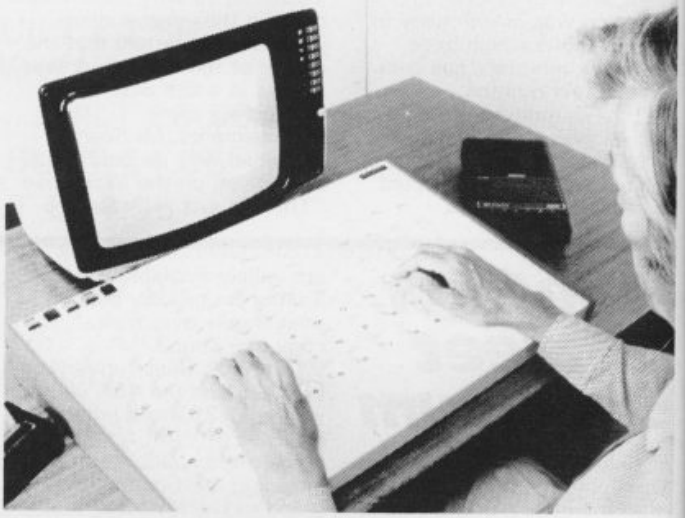
Due to the very high quality of the entries, the sponsors agreed, at the judges' recommendation, to provide for this year only, a second prize worth £2,000 and two third prizes worth £500 each. Announcing the awards at an evening reception in London, Clive Sinclair also presented the second prize to Gill Edmonds for her novel, The Common, and third prizes to Aviot John for Chasing Cursors and to Philip Latham for Sara Singing. The judges for the Sinclair Prize for Fiction were Frank Kermode, David Caute, Richard Hoggart, Mervyn Jones and Polly Toynbee.

Explained Clive Sinclair as he was about to award the prizes, "We are delighted to make these three additional awards in the Prize's inaugural year, because the authors responded so well to our purpose of encouraging new writing on critical issues. In particular, Hilda Bernstein's winning novel completely fulfilled the Prize's criteria for high literary merit combined with contemporary social and political relevance."

To be published in the New Year by Sinclair Browne, Hilda Bernstein's novel, Death is Part of the Process, is based on Ms Bernstein's own experience of political conflict in South Africa. An inside view of people and organisations that plan and carry out acts of sabotage, it deals with the tensions of actual events and the complex moral dilemmas they provoke.

The National Book League are now taking entries for the 1983 award. If you fancy trying your hand at writing a novel for the Sinclair Prize for Fiction, write for further details from Barbara Buckley, National Book League, Book House, 45 East Hill, Wandsworth, London SW18 2QZ.

# Spectrum for the disabled



As a result of close collaboration between Possum Controls and Sinclair Research, the ZX Spectrum is now available in a form which is easily operated by physically disabled people.

The Possum ZX Spectrum comes in three versions: the Desk-top Scanning device, for constant use in the office or school; the Brief-case Scanning model, a cased version allowing accessories to be carried in the lid; and the Expanded Keyboard model, for people with gross movement or tremor.

The scanning models are operated by using any Possum input to scan the light around the front panel which is a complete replica of the Spectrum keyboard. In addition, an eight-way method of selection can be employed using a joystick or footskate to provide faster selection.

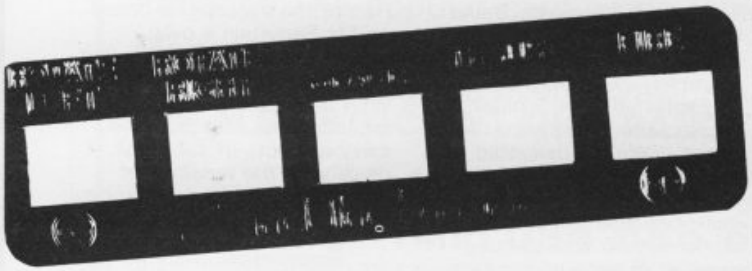
The Expanded keyboard version is an enlarged keyboard replica of the Spectrum keyboard and has the keys recessed and spread out to facilitate operation. There are also speed, delay and tone controls which can be adjusted to suit individual operation requirements.

As well as the regular Sinclair manuals, there is a Possum computer handbook which details the setting-up and operation of the Possum machines. All systems are available with 48K RAM. Possum Controls will also be making recommended educational software available.

The Expanded keyboard model can also be used in conjunction with the 16K ZX81 and, as with the other Possum products, the devices are compatible with the Sinclair range of accessories.

The price of the units is very much dependent on the input devices used with the machines and for further details, you should get in touch with Possum Controls Ltd, Middlegreen Road, Langley, Berkshire SL3 6DF or 'phone 0753 79234.

# The keys to success?



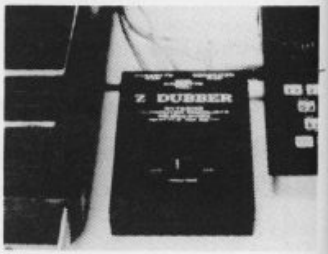
'Why hadn't it been done before' seems to be the main question being asked about this product. It's so simple and yet so useful.

Quicksilva have announced keyboard overlays which will be provided free with their games Meteor Storm and Space Intruders. The overlays fit neatly over the required keys of the Spectrum for each particular game. Then, as Quicksilva say themselves, there will be 'no more fumbling with keys and no more thrusting when you should be firing!'

# Loading problems?

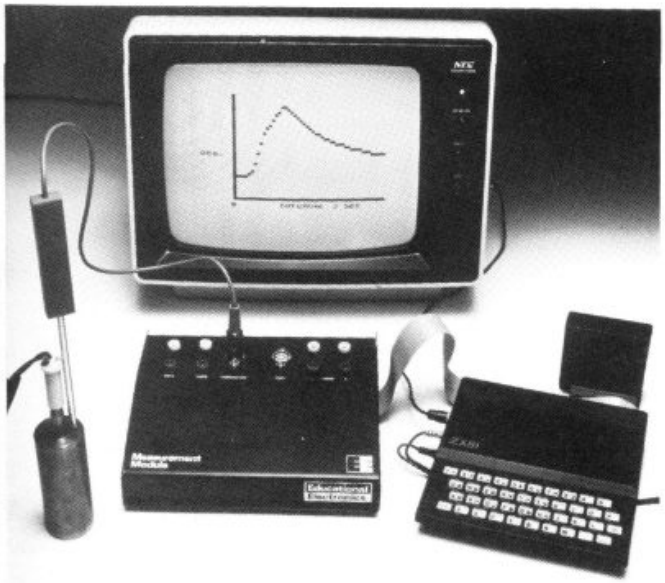
If you experience any problems loading programs on cassette into your ZX81, you may wish to consider an American product that has just come on the market.

Called the Z-Dubber, the unit (as you can see in the photograph) interfaces between the ZX81 and the tape recorder boosting the reproduction of the sound so that even the most difficult cassette program will load easily. Additionally, the Z-Dubber allows you to connect two cassette recorders together to create good backup copies of your programs.



Battery-operated, the unit sells for $29.95 in the United States, although you will probably have to add a small shipping fee if you order one from the UK. For further information on this device, get in touch with Bytesize Computer Products, PO Box 21123, Seattle, WA 98111, U.S.A.

# Measure for measure



Two new products are available to enhance the operation of the Sinclair range of computers.

The first is the Measurement Module, which is designed to operate with a ZX81, offering science teachers access to a versatile, data gathering system with a wide variety of measurement, data processing and display options.

The Measurement Module comes complete with a variety of programs which operate the Module and select the appropriate physical variable to be measured (eg voltage, current, magnetic field or temperature). Although there are no switches on the Measurement Module, it is a multi-range, multi-channel instrument. All range and channel selections are performed by the program. All the Module's functions are controlled via single key strokes from a main menu; no knowledge of programming or electronics are needed to operate the instrument.

In addition, the instrument offers outstanding protection to the user's computer against the inadvertent application of high voltage (all digital inputs/outputs to the computer pass through optical isolators, giving up to 1.5KV overload protection). The inputs to the Module itself are also capable of withstanding a very high overload thus making it suitable for use by the students themselves.

Software is the key to the instrument's flexibility. By measuring voltage and current, the program can multiply these quantities and obtain the power value in Watts. In addition, by integrating over a period of time, the instrument can act as a digital Joule meter. Data can be gathered and displayed in large digits for all the class to see or in columns of data taken at regular intervals, or automatically plotted on a graph as the experiment continues. But perhaps the unit's greatest strength lies in its ability to measure two variables simultaneously and then plot one variable against the other, thus enabling a large number of relationships between physical quantities to be rapidly investigated.

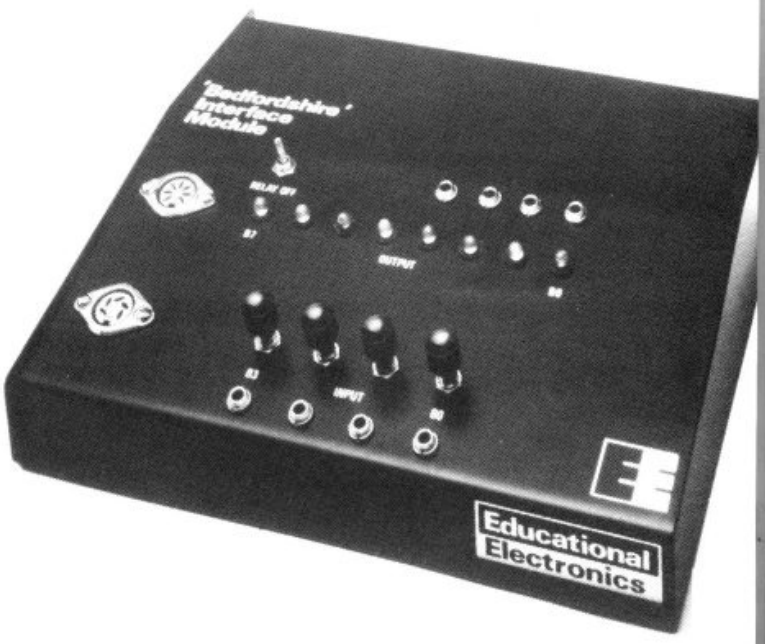
Whilst the Module is primarily aimed at physicists, it will also accept inputs from a variety of standard biological probes found in educational establishments.

The second unit available is the Interface Module which is designed to enable a Spectrum or ZX81 to be used to control robotic arms, solenoids, hydraulic and pneumatic valves, and stepper motors, etc.

The Interface Module contains four (optionally six) relays capable of switching 5A each and a stepper motor driver IC. In addition, it has a built-in traffic light sequence and all inputs to the computer pass through opto-isolators so that the computer is not damaged by very high voltages accidentally applied to the input sockets. A range of accessories such as a joystick switch, speaker box, A to D and D to A converter also plug into the Module.

Although originally designed for use in technology education by the Advisory Unit of Bedfordshire's Education Authority, the Interface Module could well be of use to the enthusiastic robotics user.

The Measurement Module and the Interface Module are priced at £98.00 and £79.50 respectively. For further information on the devices contact Educational Electronics, 30 Lake Street, Leighton Buzzard, Bedfordshire LU7 8RX or 'phone 0525 373666.



# That's handy

Midwich Computer Company Ltd have announced high quality analogue joysticks for the ZX81 and Spectrum.

The joysticks are made of injection moulded plastic and are designed to sit comfortably in the hand. Incorporated into the joysticks are potentiometers which are claimed to have a life expectancy in excess of 200,000 operations (just think how many alien invaders you could kill in that time!).

A push button is built into the handle which can be operated, for example, as a 'fire' button. Each joystick or pair of joysticks are fitted with DIN plugs to suit the Sinclair range of computers. Also, as the ZX81 and Spectrum do not have an A/D converter built in, Midwich have also designed a low cost, high speed, four channel joystick controller board. This plugs into the expansion slot of the relevant machine, and incorporates an edge connector so that other peripherals can also be added.

The joysticks are available at £15.98 per pair from Midwich Computer Company Ltd, Rickinghall House, Hinderclay Road, Rickinghall, Suffolk IP22 1HH. Telephone enquiries can be made on 0379 898751.

# Sinclair software

Sinclair Research have announced a further collection of software cassettes to complement their existing range of business, educational and games packages.

Priced from £2.95 to £14.95, there are 18 cassettes available in the new range and have been specially written by Melbourne House, Games of Skill, Artic, Psion and ICL.

There are four adventures for the 48K Spectrum including Planet of Death, Inca Curse, Ship of Doom and Espionage Island (Planet of Death will also run on the 16K Spectrum). Two other cassettes for the 48K Spectrum are Collector's Pack, which allows you to keep up to 1,500 records of stamps, LPs, etc; and Club Record Controller, which enables clubs to hold records of up to 300 members including their names, addresses, etc. A Reversi game is also available for the 16K Spectrum.

For the ZX81, Sinclair have made available 10 new software cassettes. For the 16K ZX81, there are versions of the adventure games Planet of Death, Inca Curse, Ship of Doom and Espionage, as well as Reversi, and two cassettes with Thro' the Wall and Scramble, and Super Glooper and Frogs. For the 1K ZX81, there are two packages: one providing a game of chess and the other, a collection of 11 games such as Slot Machines, Slalom, Space Pirate and Maze.

A useful ZX81 Toolkit has also been announced for the 16K ZX81 providing nine new functions: RENUMBER, DELETE, MEM, DUMP, FIND, REPLACE, SAVE and APPEND, and REMKILL.

# The Hobbit habit

Completing the new catalogue of Sinclair software is their piece de resistance, The Hobbit. Based on the fantasy land created by JRR Tolkein, the player takes on the role of Bilbo, the hobbit. This adventure program is presented in words and full colour graphics and is designed to run on the 48K Spectrum.

Perhaps the most unique factor of this program is that the user instructs the computer in completely ordinary English sentences. The Hobbit program is capable of very sophisticated communications using adjectives, adverbs and multiple sentences which the Spectrum understands. In all, the program has a built-in library of 500 words.

You get to meet all of the characters from Tolkein's book, including Gandalf, Thorin, Gollum, and many others, and best of all, they not only interact with you but act independently as well. Due to this feature, each time you take part in the adventure, events will proceed in a slightly different way, and the further you get into the land of Tolkein's Hobbit, the more different it will get.

Written by Melbourne House, The Hobbit comes complete with a copy of Tolkein's book and instructions to play. Priced at £14.95, for information on this or any of the rest of the Sinclair range of software, contact Sinclair Research Ltd, 6 King's Parade, Cambridge CB2 1SN or 'phone 0223 353204.

# May the force be with you

The people up at Work Force must have been busy of late judging by the huge selection of software they have dreamed up for the Spectrum and ZX81.

Looking first to the Spectrum software, they have devised a package called Programmer's Dream which provides the user with a number of extra features such as RENUMBER, BLOCK MOVE, BLOCK ERASE, LINE ERASE, SEARCH and REPLACE, DUMP VARIABLE/STRING, as well as commands to make a quick check on the program and variable size. The features are called from just one line of BASIC and operate instantly. The Programmer's Dream is priced at £7.00.

Other software for the Spectrum includes a Disassembler in 1,500 bytes; Di-Loader, a machine code loader to use with a disassembler; and Renumber Delete, a fast machine code loader which allows the user to define where to renumber from, what the new start should be and specify the increment. The Disassembler, Di-Loader and Renumber Delete are priced at £5.50, £7.00 and £5.00 respectively.

And if you've got a 16K ZX81, Work Force haven't forgotten you. Among the programs available are Adventure in Time, an extravaganza based in Australia where you have to use your time machine to travel forwards and backwards in time to save mankind from nuclear destruction; and A.D.V.E.N.T., an eight part program, the function of which is to create adventure games (and if that sounds confusing, a mini adventure, Treasure Mountain, is included to show you how it's done). These two packages are priced at £6.95 and £5.95 respectively. Other programs for the 16K ZX81 include Address, which allows the user to set up files of addresses on tape; ZX80 Convert, which will allow you to run ZX80 programs on your ZX81; and Greatest Games 1, a package which contains 10 games such as Pac Maze, Gobler, Star Defender, Vampires, Minefield and others. These last three titles are priced at £4.95, £4.95 and £5.00 respectively.

For more information on all these titles and the rest of the Work Force range of software, contact Work Force, 140 Wilsden Avenue, Luton, Bedfordshire or 'phone 0582 454456.

# Seriously...

A series of programs have been announced by Asher Kuehn which will turn your ZX81 into a very clever business machine.

Among those available are Matrix Planner, a matrix-based modelling and planning 'spreadsheet' program; Wordprocessor, which allows you to process text in capitals or upper and lower case characters on screen or printer; Commodity Trader, a program to help you keep a record of your trades on the commodity market with your broker; Forecast, which provides the user with market forecasts, price fluctuations and practical statistics; and three practical modelling programs based on the Matrix Planner: DCF Planner, Cash-Flow Planner and Profit-Planner.

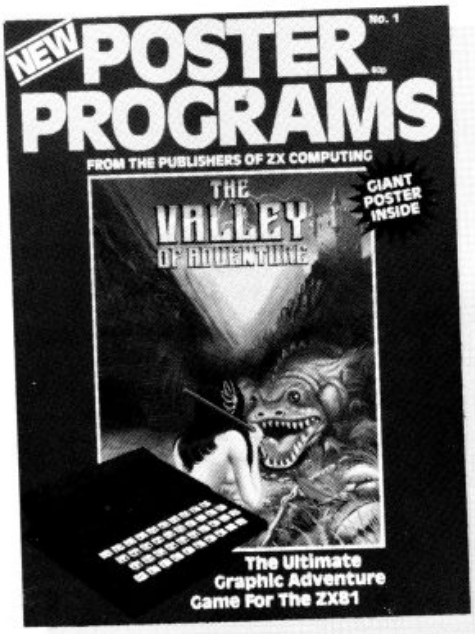
Alongside these programs, Asher Kuehn have also announced a set of mathematical and statistical programs such as Mathroutines and Fit, which can solve mathematical, technical and scientific problems; RPN Calculator, which simulates the operation of a technical calculator utilising Reverse Polish Notation; and Statistics, which covers t-statistics, chi-squared for equal and unequal expected values and 2 x K contingency tables.

And if these programs seem a little too serious for you, there are three programs which tackle the lighter side of computing. The first, Truth, is a program which enables your ZX81 to enunciate an endless succession of remarks about computing and life in the world of the computer. Using a sophisticated linguistic model to generate English sentences at random, most of its comments are amusing, all are different.

The other two programs available are Adventure and Death, a trip through a medieval castle inhabited by monsters, ghosts and treasure; and Scout 1, which puts you in the cockpit of your own spacecraft, escaping from the alien hordes.

All of these programs are priced between £5 and £10 and are available via mail order. For more information on how to obtain these cassettes, get in touch with Asher Kuehn, a division of Karmead Ltd, 60 St Leonard's Gardens, Heston, Middlesex.

# Poster problems?



In our recent publication, Poster Programs — The Valley of Adventure, some readers are experiencing difficulty with the machine code listing that more experienced users would not come accross.

To make the machine code easier to RUN and test (and harder to crash!), our author, Ray Elder, suggests you make the following changes:

2 REM followed by 41 zeros (instead of 42)
3 REM followed by 240 zeros (instead of 239)
4 REM followed by 98 zeros (instead of 103)
In addition change line 3040 to read 3040 LET F = USR 16985.

To make testing Figure 5 hex dump easier, enter PRINT USR 16985. S$ is an empty string, 32 bytes long ie, 32 spaces. It is used to clear a line. All the machine code and BASIC listings work as published.

# Soft options

A new range of software is now available from Video Software covering the fields of business, education and recreation.

Written for the 16K ZX81, the range includes Video-Sketch, a program exploiting the full graphics capabilities of the ZX81; Video-Map, a game in which you have to navigate your 'plane to its target without being shot down; Video-View, which allows the user to create a miniature view-data system; Video-Graph, a planning and design aid; Video-Index, a sophisticated indexing system allowing up to 1,000 references; Video-Plan, an electronic planning chart or 'spreadsheet'; and Video-Ad, providing an active information display. Video-View, Video-Graph and Video-Ad can also be used on the ZX80 should you possess the necessary amount of memory.

Also available are a number of games cassettes including Football-League, Test-Match, Stock-Market and Party-Tricks.

Every program is recorded twice and with the exception of Video-Index and Party-Tricks, an audio commentary describing the operation of the program is also included. All the more 'serious' programs are accompanied by a comprehensive operating manual.

A similar range of programs will soon be available for the ZX Spectrum.

All of these programs can be ordered by mail order and are priced between £3.95 and £9.95. For more information you could write to Video Software Ltd, Stone Lane, Kinver, Stourbridge, West Midlands DY7 6EQ or 'phone them on 038-483 2462.

# Club corner

Following last issue's list of user clubs, we have had a tremendous response from some of the clubs we didn't mention (mainly because we didn't know they existed).

If you run, or are a member of, a user club which caters for the Sinclair user, why not get your group on the map by writing to us at:

**Club corner,**
**ZX Computing,**
**145 Charing Cross Road,**
**London WC2H 0EE.**

All you have to do is to send us a letter with details of your club (times of meetings, addresses of who to contact, etc) and we'll do the rest. if you publish a newsheet or club magazine, we'd very much like to see that too.

## Irish Amateur Computer Club

Dear ZX Computing,
Our recently formed group, the Irish Amateur Computer Club, wish to hear from Sinclair ZX users in the Dublin area and other parts of Ireland.

Those interested should contact either Brendan Haligan at 22 Gortmore Avenue, Finglas Sth., Dublin 11 or myself at the address below. A stamped addressed envelope would be appreciated with all enquiries.
Yours faithfully,

Martin Stapleton,
48 Seacourt,
Clontarf,
Dublin 3.

## ZX Exchange

Dear ZX Computing,
ZX Exchange offers opportunities for people to make informal postal contact with ZX users in the UK and abroad. This is especially relevant to those who live in rural areas or who have no local user group.

Full details and a copy of the current ZX Broadsheet are obtainable by sending a stamped addressed envelope and an additional 10p stamp to me at the address below.
Yours faithfully,

Nick Godwin,
4 Hurkur Crescent,
Eyemouth,
Berwickshire TD14 5AP.

## Edinburgh ZX Computer Club

Dear ZX Computing,
The Edinburgh ZX Computer Club was formed in October 1981 out of the mutual interest of owners of Sinclair ZX80 and ZX81 computers. Founded by John Palmer and myself, the membership has expanded rapidly and currently stands at over 70. Naturally, the scope of the club now encompasses the ZX Spectrum.

The club provides a chance to meet other ZX owners socially and to exchange ideas and experiences. To this end, various club activities are run. Meetings are held every second and fourth Wednesday of each month in the Claremont Hotel, Claremont Crescent, Edinburgh, from about 7.30 to 10.30pm.

At these meetings, members can bring their computers along, meet other members and help solve each other's problems. There are also tutorial groups so that the

more experienced members can pass their knowledge on. Currently, tutorials are being held on beginner's BASIC, advanced BASIC, beginner's machine code, and advanced machine code.

We also publish a bimonthly newsletter which carries news of the club's activities and articles and programs written by some of our members. Another feature of the club are the occasional 'workshops' we hold on Saturdays.

Membership rates are £5 per annum, or £3 for children, students, OAPs and the unemployed.

For more information contact John Palmer, Chairman of the club, at 56 Meadowfield Drive, Edinburgh (Tel: 031-661 3183) or myself at the address below.

Yours faithfully,

Keith Mitchell,
Club Secretary,
19 Meadowplace Road,
Edinburgh EH12 7UJ.
Tel: 031-334 8483.

## Swindon Users' Club

Dear ZX Computing,
A users' club has been formed recently in Swindon especially for ZX80, ZX81 and ZX Spectrum users.

We hope to hold monthly meetings and run a software library for both copyright and non-copyright material. For more information on the club contact me at the address below.

Your faithfully,

Andrew Bartlett,
47 Grosvenor Road,
Swindon,
Wilts.
Tel: 0793 30770.

## International ZX Spectrum Club

Dear ZX Computing,
Our club will produce a bi-monthly magazine with software, hardware, reviews, contact addresses of other users and news. The objective of the club is to circulate programs around the world.

For further details of the club send an International reply coupon to the following address:

International ZX Spectrum Club,
Gabriel Indalecio Cano
Sardana,
No 4 ático 2a,
San Andrés de la Barca,
Barcelona,
Spain.

## The Association of London Computer Clubs

Dear ZX Computing,
The Association of London Computer Club (ALCC) was formed in 1980 as a result of the First London Computer Fair when the North London Hobby Computer Club (NLHCC) invited other clubs to join them in organising this event.

The Association was formed to provide a forum for the Computer Clubs in and around London to enable the clubs to assist each other and to co-operate in areas of common interest. The ALCC aims to promote hobby and recreational computing, co-ordinate the varied activities of the clubs and to organize exhibitions, seminars and meetings.

There are now 16 clubs and the chairman and secretary from each club will together form a clubs council. The main work of the ALCC will now be carried out by 10 specialist sub-committees concentrating on the above-mentioned areas of interest.

The list of computer club members include:

Croydon Micro Computer Club — Meetings are held in the Central Reference Library, Katherine Street on the first and fourth Tuesday of each month. For further information contact Vernon Gifford on 01-653 3207 or David Annal on 01-764 4043.

Harrow Computer Club — Meetings are held at the Harrow College of Higher Education, Room G43 on alternate Wednesdays at 7pm. For further information get in touch with Bazyle Butcher on 01-950 7068.

North London Hobby Computer Club — Meetings are held at the Polytechnic of North London, Holloway Road, every Monday, Tuesday, Wednesday and Thursday during term time. For further information 'phone 01-607 2789 ext. 2161.

East London Amateur Computer Club — Meetings are held at the Harrow Green Library, Cathall Road, on the second and fourth Tuesday of each month at 7pm. For further details contact Fred Linger on 01-554 3288.

North Kent Amateur Computer Club — Meetings are usually held at Charles Darwin School, Biggin Hill, on the first Thursday of the month. For further information contact Barry Biddles on Biggin Hill 71742.

Richmond Computer Club — Meetings are held at the Richmond Community Centre, Sheen Road, on the second Monday of each month at 8pm. For further information get in touch with Robert Forster on 01-892 1873.

South East London Microcomputer Club — Meetings are held at Thames Polytechnic, Woolwich, every other Wednesday at 7pm. Further details are available from Peter Philips on 01-853 5829.

West London Personal Computer Club — Meetings are held at the Fox and Goose, Hanger Lane, on the first Tuesday of each month at 7.45pm. For more information contact either Graham Brian on 01-997 8986 or Neil Cryer on 01-997 9437.

Worcester Park Computer Club — Meetings are held in the Windsor Road Library on the first Monday of each month at 7.30pm. Further details of the club may be obtained from the library on 01-337 1609.

Other Clubs include: Post Office Headquarters (BT & PO), ICPUG(SE), Metropolitan Police, Home Office, ITN, Guildhall and BASUG. Clubs in the following areas are also being organised: Wandsworth, Sutton, the Isle of Dogs and Westminster.

Yours faithfully,

Robin Bradbeer,
Polytechnic of North London,
London N7.

**V & H COMPUTER SERVICES PRESENTS**

## SPECTRUM SPECTACULAR

(50 Programs for the Sinclair Spectrum)

And what programs! New games! Old games! Business programs (like invoicing and sales ledger), word processor, machine code routines, graphics....

All in **SPECTRUM SPECTACULAR** the new book by Roger Valentine.
**SPECTACULAR VALUE AT £4.95**

By the same author:—

**WHAT CAN I DO WITH 1K? (ZX81)..... £4.95**
**WHAT CAN I DO WITH 16K? (ZX81)..... £4.95**

**V & H COMPUTER SERVICES**
**182c KINGSTON ROAD,**
**STAINES, MIDDX.**
**TEL: STAINES 58041**

**Business users please note:** Our PAYROLL program is now available for ZX81, SPECTRUM, PET, BBC and KONTRON. Please write for details or send £2.00 for comprehensive manual.

NEW

From Warp Factor Eight

## Lift-off into '83 with HI-STAK

- makes your computing easier, faster, more reliable, less exhausting and simply more enjoyable.
- angles your computer neatly to the correct ergonomic position for the most efficient keyboard operation.
- provides extra ventilation for hot ZX81's and Spectrums.
- instantly applied.
- styled for '83, adds that professional look to your set up.
- precision injection moulded in quality ABS, non scratch – non slip base.

ZX81
SPECTRUM
VIC20
TRS80
NEW BRAIN
JUPITER ACE
Etc.

**Order form.** Please send me____HI-STAK set(s) (at £3.95 per set). I enclose cheque/P.O. for_____

## MANAGEMENT GAMES

## 16K ZX81 Spectrum

ALL PROGRAMS AVAILABLE FOR 16K ZX81, SPECTRUM 16K and 48K

NEW

### DALLAS

A game of oil exploration and exploitation in Texas. Decisions are required on purchasing concessions, the movement and use of drilling rigs, and the building of platforms and pipelines. Can you take-over the Ewing Empire, or will you be taken-over in the attempt!

### AUTOCHEF

As MD of a Catering Company you must negotiate for leases, decide on menu prices, level of wages, advertising and dividends. Each year you must predict the inflation rate. You will be made to resign if you are not successful. There are 3 levels of difficulty.

### AIRLINE

Can you compete with British Airways? You must decide on the number of aircraft to operate, staffing and maintenance. Problems encountered are tax demands, strikes, cancelled flights, hijacks and aircraft crashes.

### PRINT SHOP

You own a small printing company and are required to decide on (a) the number and type of staff you employ and when to increase or reduce staff (b) the amount and type of paper you stock (c) the week in which work is scheduled (d) the quotation for each. There are 3 scales of difficulty.

### FINANCIAL MODEL — MODELLER X

This is a user friendly business modeller which provides Managers with a tool to plan the strategic decisions of a business. The model shows the profit sensitivity and the interaction of the pertinent marketing and production factors of a business. A user manual is included in the price of the program.

EXCELLENT ROYALTIES PAID FOR SINCLAIR SOFTWARE

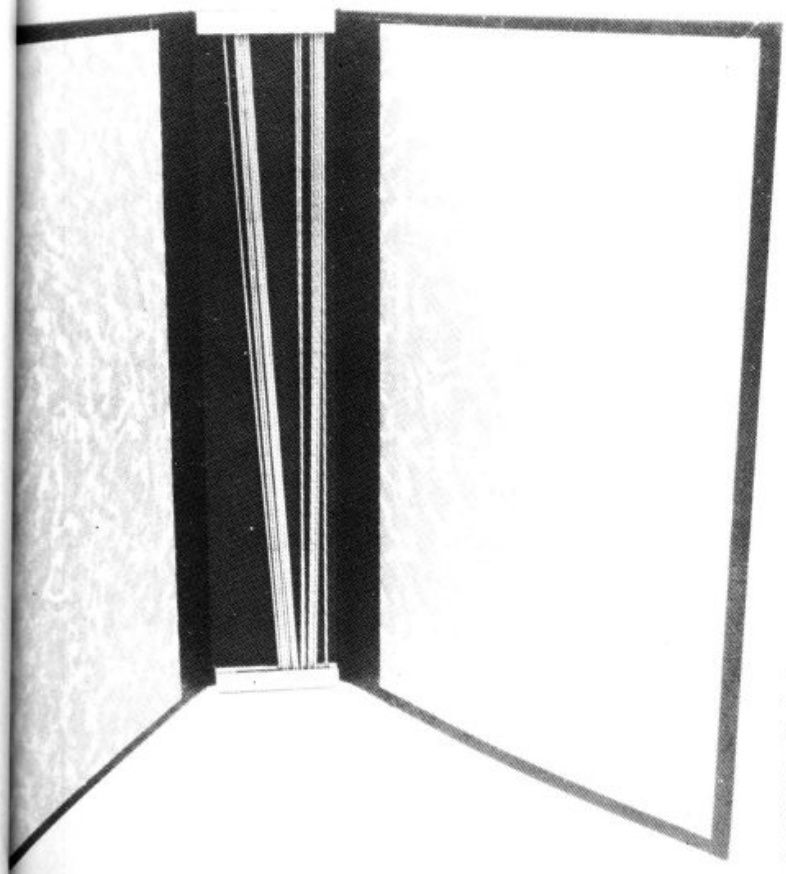
# SAVE £4.25 by receiving a FREE magazine binder when you subscribe to ZX COMPUTING



It's true, by subscribing to ZX Computing you will not only receive your personal copy direct to your door for a whole year but also have a superb A.S.P. magazine binder in which to keep your copies AND IT'S FREE!

All you have to do to receive your FREE binder is book a new subscription or renew an existing subscription to ZX Computing before 30th April 1983. What could be simpler? Normally priced at £4.25, these attractive binders will hold approximately 12 issues of ZX Computing.

Not for you any longer the chore of having to track down dogeared copies of your favourite magazine, instead you will merely go to your bookshelf and they will be waiting for you in pristine condition.

Don't miss out on this outstanding offer — subscribe today and receive your FREE binder within 14 days of your order being received.

Cut out and SEND TO :

ZX COMPUTING

513, LONDON ROAD,
THORNTON HEATH,

# Sums and fun for infants

## We present an incredible educational software package written for us by Mr P E Bloxham of Loughborough.

This program is written for the ZX81 and occupies 14½K of memory so you'll need to use a 16K RAM pack. Designed for 5-6 year olds, the program comprises a mixture of simple arithmetic tasks and easy-to-play games, the sequence of which is purely random, offering interest and variety to help stimulate the child's learning and retain the child's attention for a reasonable length of time.

When you've typed the program in, you will be greeted with a friendly 'Hello, my name is ZX81, what is your name' to which you will reply with your name. The program then takes you through a series of simple teaching tests followed by a number of games if you manage to get the answers right.

Among the teaching tests are 'Biggest and Smallest' where you have to identify which of two numbers is biggest and which is smallest; 'Simple Sums' in which you are encouraged to attempt basic addition and subtraction; and 'Sort the Numbers' in which you have to sort six numbers into their correct order of magnitude. Where the child is unable to enter the correct answer, after a number of attempts, the correct answer is given. After all entries, except in the games, Newline should be used.

There are also a couple of programs which produce nice effects on the screen. These are 'Fun Time' which draws shapes on the screen such as flowers, spirals and circles; and 'Sign Writer' in which you type your name and the letters are made up into a sign which is moved across the screen.

The games provided in the package are simple, but give a break from the 'number crunching'. Some are offered as reward for correct answers to the sums, while others will be offered to the child quite randomly. There is a bias, however, towards the sums rather than the games, so the child should spend more time involved in the former. The games programs include 'Star Crash' in which you must dodge the falling stars; 'Racing Car' in which you guide a racing car around a track without hitting the sides; and 'Catch a Falling Star' in which you move along the bottom of the screen and try to catch the stars which fall from the top of the screen. The games all have simple instructions and are very user friendly.

There are also some very nice programming touches which should appeal to younger users. For example, should you get the answer to one of the problems wrong you will get a large frowning face on the screen asking you to try the problem again. Should you get the answer right, you are rewarded with a smiling face and a congratulations message.

The program runs at a fairly slow pace so as not to leave the child behind, but can be speeded up if necessary, by adjusting the FOR. . . NEXT loops – used in preference to the PAUSE statement which gives that distracting screen flicker. Likewise, the sums have been kept simple, but could be made more difficult by extending the range of random numbers used.

Initially, children may need a little help from parents but very soon, at the highly receptive age of 5 or 6 years, they will be more than able to use this program pretty much unaided. This program presents a complete package for the younger ZX user, being both fun to use as well as educational.

# Defending your Spectrum

**David Cross of Wolverhampton has written us a great program in which you have to defend the Earth from the invading aliens.**

NOW AVAILABLE FROM ASP SOFTWARE

See page 114 for further details

Not an easy game this! You have three ships, and your mission is to rid the planet's surface of invading aliens.

Each time you fire a missile at an invader and destroy it you will be awarded 60 points but watch out, your missiles may not always destroy the aliens. If an invader hits you then you will lose one of your ships. The only way to get more ships is to increase your score; you will get an extra ship when your score increases to 5,000, 10,000, 15,000 and 20,000.

The control keys for the game are as follows:

The '1' key moves your ship down
The 'Q' key moves your ship up
The 'P' key fires a missile
The 'T' key stops the game

Once the program has been typed in and RUN, you will have to wait four seconds for the game to start – not long really, when you consider the fate of Earth is in your hands!

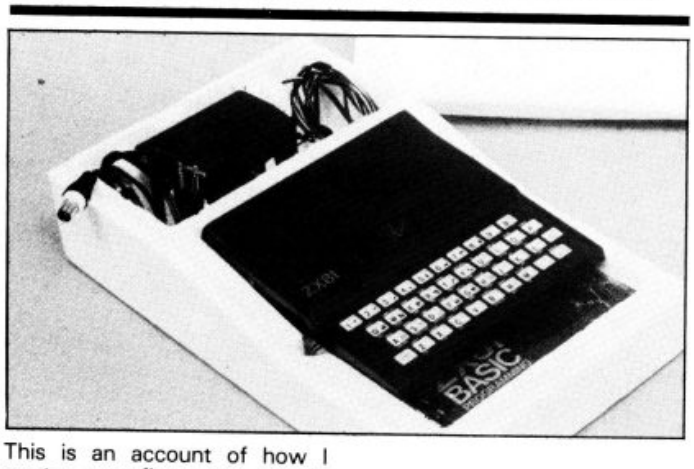
# How I wrote my first machine code program

## Ian Turtle, of Ashby, Scunthorpe, explains how he got to grips with machine code, the problems he faced, and the triumph he achieved.



This is an account of how I wrote my first program in machine code, following the study of Toni Baker's book 'Mastering Machine Code on the ZX81'. It was a real struggle to get the program actually working, as many of my initial assumptions were proved wrong.

At first, I wrote a BASIC program to search through a program, and convert all the letters, numbers and the like to inverse video; this not only looks good, but allows REM statements to stand out in listings so long as there are not too many PRINT statements in the program.

The program sat at the bottom of program memory, and had to be typed in after the program which I wanted to transform had been entered. My BASIC program to do this is shown in Listing 1.

```
9500  FOR I=16509 TO PEEK 16396+256*PEEK
      16397
9510  IF PEEK I Â234 THEN GOTO 9590
9520  LET I=I+1
9530  IF PEEK I=118 THEN GOTO 9590
9540  LET A= PEEK I
9550  IF AÂ63 THEN GOTO 9520
9560  LET A=A+128
9570  POKE I,A
9580  GOTO 9520
9590  NEXT I
9600  LIST
```

*Listing 1*

Line 9500 finds the end of the program area, and sets up a FOR. . .NEXT loop to search the listing. Line 9510 checks if the byte is a REM keyword. If not, it jumps to line 9590 and back around the loop. Once a REM statement is encountered, then it begins to execute the lines 9520 to 9580. Line 9520 increments the I count to the next byte in the REM statement. Line 9530 checks for a NEWLINE, and the end of the REM statement. If the end of the REM has been found, then the program again begins to search for another REM in memory. If the end has not yet been reached, then the code of the character is checked. If it is greater than 63 then it is likely to be a keyword with no inverse, or a letter/number that is already reversed, so the loop skips this byte.

If its value is less than, or equal to, 63, then 128 is added to the value to get the inverse (line 9560). Line 9570 then POKEs this value into memory and line 9580 returns to check the next byte in the program. Enter the program, and add a line like 9951 REM XXXXXXXX and RUN the program. The listing will appear with the Xs after the word REM in inverse as required.

Unfortunately, it takes the program three seconds to achieve this. Admittedly, three seconds is not long to wait, but if this program had to sort through a 15K program it would take minutes. To be frank, I thought this would be more trouble than it is worth.

### Eureka!

The obvious answer was to put it into machine code. Unless you are a computer fanatic, then I would not lightly recommend you take the drastic step of deciding to tackle machine code.

If you find BASIC programming makes you tear your hair out in frustration with its error messages as you debug your latest masterpiece, do not attempt to write machine code, or you'll soon need the services of a hair-transplant specialist. It is the most frustrating experience I have ever gone through. Despite this, the result were well worth all the effort.

The frustration made me write a simple BASIC program to aid the development of machine code, but more about that later. Eventually, the program was written and debugged, and is shown in Listing 2.

| | Op-code | Hex | Decimal | Bytes |
|---|---|---|---|---|
| START | LD HL,16549d | 21A540 | 33,165,64 | 3 |

| | LD (HL),A | 77 | 119 | 1 |
| | JR INREM | 18F1 | 24,241 | 2 |

*Listing 2*

*Programming in machine code can make you old before your time.*

This is simply a straight translation of the BASIC into machine code. Location 16514 inwards (ie a REM statement as the first line of a ZX81 program) is my favourite place to store machine code, so the program was written to occupy these memory locations. In theory, however, the program is completely relocatable, as there are no JPs as opposed to JRs (things you have to come to terms with when programming in machine code). In practice, this assumption proved incorrect.

The HL register at the start of the listing is set to 16549 instead of 16509 to skip over the actual REM statement. If this was not done, the machine code would search itself, find the 243d one instruction after REMCH and assume this was a REM statement. Then it would alter all the machine code which followed, until it reached the 118 two instructions after IN-REM. Obviously, this would cause a crash.

If, then, the machine code was relocated, it would still begin its search at memory location 16549, and miss any early REM statement. The solution was simply to substitute 16509 in START.

The idea behind relocating the routine was to place it above RAMTOP, to save having to reload machine code over and over again in a programming session. However, disaster struck when the machine code was used to invert all the REM statements in the actual 'machine code loader' program. For some reason, it corrupted the line which read:

```
3050 IF B$ = "D" THEN LET
     A$ = STR$ B
```

To find out why, it was necessary to find out how the 8K ROM stored line numbers.

I discovered that the computer stores a line number in four bytes. The first two bytes contain the value of the line number, and the second two bytes indicate how many bytes long the line is. So a line 10, LET A PEEK 1, would have the four 'line number' digits reading 00 0A 06 00. Strangely, the computer has a 'double standard' here. The line number is stored with the high byte followed by the low byte. The length of the line, however, is stored the other way round, with the low byte first.

## Back to the beginning

To return to the original problem, the line number 3050 will be stored in memory as 0BEA, where EA is the value the program searches for. So, the length of line marker will be overwritten – not a good way to keep a bug-free program. With this knowledge, it is obvious that there is a set of numbers that would cause this problem. It was luck that uncovered this bug (the numbers are 234, 490, 746, 1002, 1258, 1514, 1770. . .).

This was all very satisfying in its way, but it meant the original machine code program was practically useless, as it would have meant the user had to search through the listing and change every occurrance of the line number set to something else, running the code, then changing them all back. A return to the BASIC listing would obviously be a better idea. "Back to the drawing board", I thought, and attempted a new approach.

I do not think it is just me. However, I find it very difficult to produce a brand new method, or idea, straight after an old one had been tested and made to work. However, the papers with a disassembled listing (BASIC) were close to hand. It was while rereading these that the idea of using the length of line indicator occured. Obviously, I cannot claim monopoly on this idea – I had read of its use elsewhere, but I had not previously thought of using it here. Anyway, it sounded rather complex. In fact, it did cause the machine code to be a little more complicated, but not too difficult.

The machine code listing was longer, but it used the fact that the REM indicates the end of a listing by two Newlines on the trot to check for the end of the program. It was with this listing I was finally satisfied. HL was loaded at START with 16509 since I had finally decided to go for storing the machine code above RAMTOP for more convenience. This was done as follows:

```
ENTER POKE 16388, 216
      POKE 16389, 127
      NEW
```

Then the machine code can be written, starting at address 32729.

So, after many hours , the listing below was produced, which did the job demanded of it in the blink of an eye,as opposed to minutes. I tested it on the longest program I could find, and it took no noticeable running time at all. As a conclusion, I'd say that if you're willing to stick at programming in machine code, the results will be well worth the cost in frustration.

# ANDREW HEWSON'S BOOKS

## 20 BEST PROGRAMS for the ZX SPECTRUM WITH EXPLANATORY TEXT

Mr HELPLINE – the man who answers your ZX queries in his column in Sindair User, the author of HINTS & TIPS FOR THE ZX80 and HINTS & TIPS FOR THE ZX81 now presents:

* 20 original programs for you to load into your Spectrum.
* 20 interesting programs for you to enjoy and learn from.
* 20 great programs to teach you about fixed and variable length records, binary searches, bubble sorts, graphic displays and much, much more . . .

Program titles include:

Machine Code Editor – Write, modify, extend and load machine code using this all-basic program. No need to use an Assembler when you have this program.

Index File – Learn about fixed length records, save numeric and string information, add to, sort, modify, delete and print your records. Ideal as a computer based filing system.

Duckshoot – Learn how to manipulate the attributes file *and* have fun at the same time.

Graphix – Construct up to 210 graphics characters with the full on-screen editing facilities, enhance and modify them and recall them later to build a detailed display to save on cassette.

Spiromania – A program to stretch your artistic talents, imagination and ingenuity. Draws a limitless variety of curves and spirals.

Plus: FOOTBALL, DIGITISER, DIARY and many more.

Available through Computer Bookshops and W.H. SMITH.

## FOR THE SPECTRUM

### 40 BEST MACHINE CODE ROUTINES FOR THE ZX SPECTRUM £5.95

by Andrew Hewson and John Hardman.

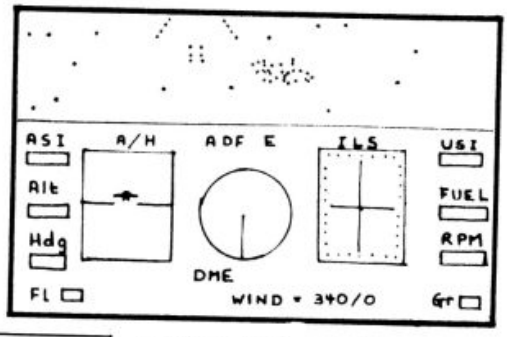
Section A: Three chapters explaining what you need to know about Z80 machine code on the Spectrum.
* How to load and save machine code.
* How to use the system variables.
* How memory is organised.
* How program lines are stored.
* How to use the stack, the display, the attribute files.
* How to call ROM routines – where they are and what they do.
* The structure of Z80 code – plus a valuable glossary.

Section B: 40 routines including,
* Scroll – up, down, side to side by pixel or by character.
* Search and replace, token swap, string search.
* Rotate character, invert character – horizontally and vertically.
* Line remember – including GOSUBs, GOTOs, RUN etc.

All routines are relocatable (except 'line remember')

This book teaches the beginner all he needs to know in a simple, easy-to-learn form and its an invaluable reference work for the expert too!

### NIGHTFLITE FOR ZX SPECTRUM £5.95



Fly your own aircraft from take off to landing via navigational beacons, over mountains and using a fully detailed direction finding and instrument landing system. *You are the Pilot of a light aircraft flying at night. *You must use your skill and judgment to fly your aircraft accurately over radio beacons and then land safely on the runway *Hazards are mountains and cross winds *Instruments: Artificial Horizon, Non Directional Beacon, VHF Omnidirectional Range, Instrument Landing System *Readouts: Gear, Flap, Air Speed, Distance Measuring Equipment, Vertical Speed, RPM and heading *Visual display of runway on approach *5 Modes from Take off to Autopilot *Happy landings *

### Z80 OP CODES £1.45

A must for the beginner and the experienced programmer alike. This hand ready reckoner lists all 600 plus Z80 machine code instructions in decimal and hexadecimal with their mneumonics. Each Op Code is succinctly explained and cross-referenced. Supplied in a protective transparent wallet for easy reference and durability.

### PILOT ZX81 £5.95

Essentially the same as Nightflite but without the hi res graphics.

### PUCKMAN ZX81 £5.95

All action display. Best score to date, scour the maze for food, dodge the ghost, eat a strawberry and attack the ghosts.

### HINTS & TIPS FOR THE ZX81 £3.95

Available by direct mail order or through computer bookshops and W.H. Smith.

### THE PROGRAMS

The programs advertised here are available from computer bookshops with a software stand, and many independent micro-computer shops.

### RETAILERS

We are continually on the look out for new outlets. If you are interested in stocking the items advertised here, write to us for our trade rates.

### URGENT

We require high quality Spectrum and Dragon software. Good royalties paid. Send your samples today for fast evaluation.

# Scrolling that screen window

## J Elliott from Gloucester describes some machine code routines he has developed to emulate some screen controls available on more sophisticated computers.

As a teacher I have access to both an RML 380Z and 480Z in the course of teaching Computer Studies. These computers allow fairly easy screen control. In particular they allow the definition of "screen windows" at any point on the screen. These windows may be scrolled independently of the remainder of the screen. In addition to this, the "GRAPH" command restricts scrolling to the bottom four lines of the screen.

My own ZX 81 does not have these facilities. The "PRINT AT" command is the nearest equivalent. I decided to attempt to emmulate these facilities with machine code subroutines. The three routines to be described increase the screen handling abilities of the ZX81 quite considerably.

The first routine defines a rectangular window of any size at any point on the screen. Once defined, the window can be instantly filled with any character, or cleared, simply by calling the routine. Any of these parameters can be changed at any time from the master program. This means that several different windows can be used with the same program.

The second routine uses the same principle as the first. A window is again defined — any size and any position on the screen. When the routine is called, the contents of the window are scrolled up through one line and the last line is cleared. The routine can be set to fill the last line with any character instead of clearing it.

The last routine is a very simple screen reverse. Every character on the screen is removed and replaced with its inverse. This is very effective for explosions.

### Using the routines

The easiest way of using the routine is as follows;

First type in listing 4 and save at least twice.

Save 114 bytes of high memory by poking addresses 16388 and 16389 with a new value for ramtop. With a 16K machine, suitable values are ; POKE 16388,140 POKE 16389,127.

If you now enter 'NEW' you will have the space above 32652 free for the machine code.

Now reload listing 4 and 'RUN'. The code will be loaded to the area of memory you enter when prompted by the program. You will now be prompted to enter size and positions for your window or scroll window and also fill character. Having done this you are offered the option of redefining, testing or ending the program. When you end the program is automatically 'NEWed' so that you can easily enter the BASIC code which will call the routines.

To call the routines, the following commands can be inserted at any point in the BASIC;

i) Fill or clear window — LET L=USR START

ii) Scroll one line of window — LET L=USR (START+39)

iii) Inverse screen-LET L=USR (START+94)

Where START is the start address of the machine code which must have been previously loaded the parameters of the windows can be changed easily from ▶

within the BASIC program using the routines, by 'POKEing' the following addresses with suitable values;

## Fill window

(START +5) = last line of window
(START +7) = number of lines of window
(START +20) = 32-start column of window
(START +25) = columns from end of window to line end
(START +30) = fill character code

## Scroll window

(START +44) = last line number in window
(START +46) = number of lines in window
(START +59) = 32-start column number
(START +64) = columns from end of window to line end
(START +85) = scroll character code

The program shown in listing 5 demonstrates how this is done. It produces random windows and fills or scrolls them with random characters. It can produce some quite effective patterns!

I have included listing 1, 2 and 3 for those of you interested in the assembler for these routines.

## Memory

To run the routines as described you need at least 3.5K of memory. Those of you with less than this will need to create a display file by 'PRINTing' spaces to the screen before you attempt to use the routines. The routines will work perfectly well with an 8K ROM ZX80 but the following changes must be made to the loading and demonstration programs;

## Loading program

Line 100 INPUT D$
Line 520 INPUT M$

## Demonstration program

Add line 115 PAUSE 100
Add line 116 POKE 16437,255

Whenever these routines are used, you will have to use 'PRINT AT' to print to the windows. The normal 'PRINT' statement will print in the normal way to the whole screen.

```
2A 0C 40    START       Ld HL, (Display File)   ;find screen in memory
23                      INC HL                  ;find first screen location
0E x                    Ld C,x                  ;number of lines to rectangle
3E x        RECTANGLE   Ld A,x                  ;rectangle length end
B9                      CPC                     ;start reached?
30 06                   JRNC BEGIN              ;
11 21 00                Ld DE 0021H             ;
19                      ADD HL, DE              ;move one line down screen
18 12                   JR END                  ;

# Rat race

**Join the rat race with this program for your ZX81. Phil Lester admits to having had a lot of fun writing it and hopes you'll have fun playing it.**

Rat Race is a game for two to four players and occupies 4K of memory, so you'll need your 16K RAM Pack.

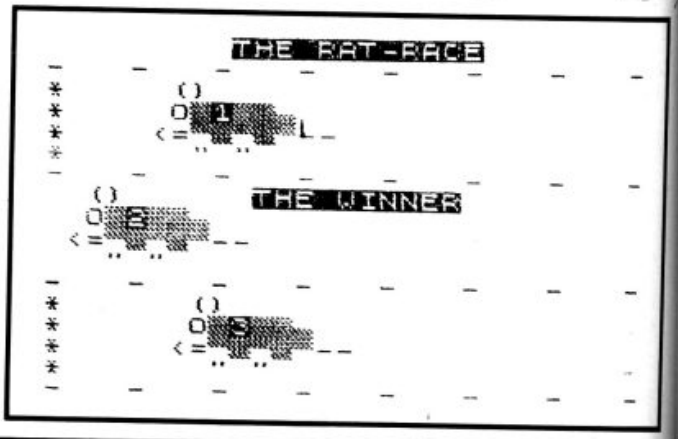
Each player has a rat each and £200 with which to have a bet (you may only bet on your rat). If your rat wins then you win the amount you wagered and this is added to your cash total. Should you lose, the amount of your flutter is deducted from your cash total. Should your cash total reach zero, you are pronounced broke.

*Sample screen displays.*

```
PLAYER NO.1 NAME? LOUIE
PLAYER NO.2 NAME? DOUIE
PLAYER NO.3 NAME?

LOUIE     YOU HAVE £200
WHAT WILL YOU BET ON NO.1? £100
HOUIE     YOU HAVE £200
WHAT WILL YOU BET ON NO.2? £150

DOUIE     YOU HAVE £200
WHAT WILL YOU BET ON NO.3? £50
```



and out of the game.

Once the amount of each bet has been recorded, the race is on. Once all players have run out of money, another game is offered to which the reply yes (Y) or no (N) must be entered.

**MEMOPAK 16K** For those just setting out on the road to real computing, this pack transforms the ZX81 from a toy to a powerful computer. Data storage, extended programming and complex displays become feasible.
For even greater capacity, memory packs can be added together (16 + 16 + 16K or 16 + 32K). The MEMOPAK 32K and the MEMOPAK 64K offer large memories at economical prices.

# MEMOTECH

The Memotech approach to microcomputing is to take the well-proven and popular ZX81 as the heart of a modular system. This small computer houses the powerful Z80A processing unit and acts as the central processor module through which the MEMOPAKS operate.

Memotech has a reputation for professional quality, producing units which are designed to fit perfectly, to look well-balanced, and to work efficiently and reliably.

The modular approach gives ZX81 owners the freedom to design the system they really need. Furthermore, the intercompatibility of the modules ensures that later additions will click straight in, to give you a system that grows with your ambitions and abilities.

As one example, a system with 16K of memory and MEMOCALC is all that is required to perform sophisticated numerical calculations giving the same results as a computer at 10 times the price. The problem may be as complicated as a cash flow or production schedule, or as simple as household accounts or pocket money budgeting. If the bank manager wants to see the cash flow, then a single print instruction to the Centronics I/F will give a printout which is more than acceptable to any bank.

The example system which is shown, on the other hand, would satisfy the needs of someone who wanted to enter data via a light-touch keyboard, construct and label graphs, and then copy the screen to an 80-column printer. Only 16K of memory is used here but with additional memory, more than one video page can be stored. Up to 7 successive pages can be displayed cyclicly to give animated displays.

**MEMOCALC** The screen display behaves as a 'window' on a large sheet of paper on which a table of numbers is laid out. The maximum size of the table is determined by the memory capacity, and with a MEMOPAK 64K a table of up to 7000 numbers with up to 250 rows or 99 columns can be specified. Each location in the table can be either a number which is keyed in or a formula which generates a number. Every time the command to 'calculate' is given, all the formulae in the table are re-evaluated. Spreadsheet analysis started as an aid to cash-flow analysis, but this powerful tool has now been generalised and MEMOCALC with its special ability to perform iterative calculations is invaluable in the performance of numerical tasks.

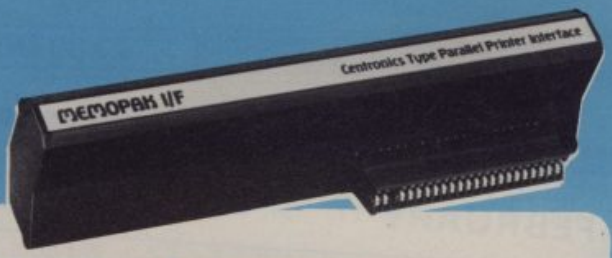
Memotech products are available at larger branches of WHSMITH

**MEMOPAK HRG** This pack breaks down the constraints imposed by operating at the ZX81 character level and allows high definition displays to be generated. All 248 × 192 individual pixels can be controlled using simple commands, and the built in software enables the user to work interactively at the dot, line, character, block and page levels. Scrolling, flashing and animation are all here.



**MEMOPAK Centronics I/F** The BASIC commands LPRINT, LLIST and COPY are used to print on any CENTRONICS type printer. All ASCII characters are generated and translation takes place automatically within the pack. Reverse capitals give lower case. Additional facilities allow high resolution printing. The full capabilities of your printer are now under the control of the ZX81.

# REALISES THE ZX81 POTENTIAL

**MEMOPAK Z80 Assembler** This click-in EPROM based pack accepts standard Z80 assembly language mnemonics to allow you to write faster and more compact programs. It has its own ADD, EDIT, LIST, ASSM and QUIT functions, the editor allowing insertion, deletion, automatic line renumbering and error checking. Source code and object code listings can be displayed and printed in decimal or hex format.

**MEMOTECH Keyboard** The light-touch positive stop keys of this elegant typewriter-pitch keyboard allow you to work faster, more accurately and more confidently. To speed you along we have added an extra SHIFT key to the array at top right. The keyboard is attached by a cable to the Keyboard Buffer which fits in amongst your other Memopaks or straight onto the back of your ZX81.

To ensure that your expectations are realised, care is taken at every stage to design features into the system to anticipate your frustrations and to forestall them. For example:
A) Memories are cumulative e.g. 16K and 32K can be added to the MEMOPAK 16K or even to the Sinclair 16K RAM pack.
B) The HRG firmware allows commonly used constructions (such as scrolling, shading and labelling graphs), which might otherwise be beyond the user's programming capabilities, to be evoked by a few simple commands.
C) The Centronics I/F converts ZX81 character codes into ASCII and extends the print line to the width of the printer, still using the LLIST, LPRINT and COPY commands.

Looking forward, Memotech will continue to back the ZX81 through 1983 with fast storage devices, pressure sensitive electronic drawing boards and more software packs including a wordprocessor and an RS232 interface.

MEMOPAKS may be ordered by post (cheque, Access/Barclaycard quoting number) or by telephone. Please make cheques payable to Memotech Ltd. and please include £2.00 per unit for packaging and postage inland (overseas £3.00).

We want to be sure you are satisfied with your Memopak – so we offer a 14-day money back guarantee on all our products.

Diary is a user-friendly program written for the ZX81 with 16K RAM Pack.

When the program is RUN, line 80 displays a pleasantly-formatted menu providing a choice of six items. Item 1 produces a prompt for the entry of data couples which should be entered one couple at a time. The data couples should be entered in the form of a 10 character name and an eight digit code – this can be modified to take date and time. Entry must be in the form of name (A$) followed by Newline, and date (Z$) followed by Newline. A prompt in line 1150 has been included to avoid returning to the menu each time a data couple is entered. Provision is made in lines 10 and 20 for 200 data couples to be entered.

Item 2 gives a scrolled display of all the items currently entered plus a warning that the menu is about to be returned after completion of the scrolling. The menu is then returned.

Item 3 prints a list of the items and then returns to the menu. If you have much fewer than 200 items of data, it's a wise move to BREAK execution at this point and GOTO 80 as otherwise you'll use up a lot of paper for nothing!

Item 4 finds a name. A cue is presented asking you to input the name to be found. The search is made based on the initial three letters of the input name; for example, 'BILLY' will turn up the names 'BILL', 'BILKO', 'BILLS' and 'BILLY', so don't be surprised if you get more names than you expect. You will be informed of a failed search as well as a completed search, but with 200 items to search through this search may take some time. When you have found your chosen name, you have the option of copying the information onto a printer or else returning to the menu. If COPY is chosen, the computer will return to the menu once the printing has been accomplished. When a given name or names are found, the corresponding dates of entry are always displayed next to the names.

Item 5 does more or less the same as Item 4, but it will search for a given date rather than the name. Once found, the date will be displayed first, followed by the names entered on that date.

Item 6 saves the program to tape after setting up a safeguard in the form of a question which requires the answer yes (Y) or no (N) before it will execute a save. The computer then displays a 'save begins' message and starts to execute the save.

## A note in your diary

The program must not be RUN when full or nearly full of data. Always GOTO 80. This should be overcome when saving from within the program since this automatically returns the menu when re-loaded.

As this program is a diary, you are able to make a few entries every day saving, adding and saving again until all 200 entries have been made or your chosen period has elapsed.

The program is aimed at those of you who have to make a record of past activities, although it could also be used to keep track of future commitments. Chris Wilder, the author of the program, used the program to keep a record of the customers he visits. The 'find name' option in Item 4 is very useful for Chris as he often wants to know when the last time was he saw a particular customer.

It is advisable to leave out redundant zeros when entering dates and to use full stops instead of dashes (simply because it's quicker to enter dots on the ZX81! The abbreviated dates will make data searches much quicker as well.

Extremely simple in concept, with the multitude of prompts and automatic returns, Diary should be able to operated by anyone with a minimum of instruction.

# Sinclair ZX Spect

## 16K or 48K RAM... full-size moving-key keyboard... colour and sound... high-resolution graphics...

## From only £125!

First, there was the world-beating Sinclair ZX80. The first personal computer for under £100.

Then, the ZX81. With up to 16K RAM available, and the ZX Printer. Giving more power and more flexibility. Together, they've sold over 500,000 so far, to make Sinclair world leaders in personal computing. And the ZX81 remains the ideal low-cost introduction to computing.

Now there's the ZX Spectrum! With up to 48K of RAM. A full-size moving-key keyboard. Vivid colour and sound. High-resolution graphics. And a low price that's unrivalled.

### Professional power– personal computer price!

The ZX Spectrum incorporates all the proven features of the ZX81. But its new 16K BASIC ROM dramatically increases your computing power.

You have access to a range of 8 colours for foreground, background and border, together with a sound generator and high-resolution graphics.

You have the facility to support separate data files.

You have a choice of storage capacities (governed by the amount of RAM). 16K of RAM (which you can uprate later to 48K of RAM) or a massive 48K of RAM.

Yet the price of the Spectrum 16K is an amazing £125! Even the popular 48K version costs only £175!

You may decide to begin with the 16K version. If so, you can still return it later for an upgrade. The cost? Around £60.

### Ready to use today, easy to expand tomorrow

Your ZX Spectrum comes with a mains adaptor and all the necessary leads to connect to most cassette recorders and TVs (colour or black and white).

Employing Sinclair BASIC (now used in over 500,000 computers worldwide) the ZX Spectrum comes complete with two manuals which together represent a detailed course in BASIC programming. Whether you're a beginner or a competent programmer, you'll find them both of immense help. Depending on your computer experience, you'll quickly be moving into the colourful world of ZX Spectrum professional-level computing.

There's no need to stop there. The ZX Printer – available now – is fully compatible with the ZX Spectrum. And later this year there will be Microdrives for massive amounts of extra on-line storage, plus an RS232 / network interface board.

### Key features of the Sinclair ZX Spectrum

- Full colour – 8 colours each for foreground, background and border plus flashing and brightness-intensity control.
- Sound – BEEP command with variable pitch and duration.
- Massive RAM – 16K or 48K.
- Full-size moving-key keyboard – all keys at normal typewriter pitch, with repeat facility on each key.
- High-resolution – 256 dots horizontally x 192 vertically, each individually addressable for true high-resolution graphics.
- ASCII character set – with upper- and lower-case characters.
- Teletext-compatible – user software can generate 40 characters per line or other settings.
- High speed LOAD & SAVE – 16K in 100 seconds via cassette, with VERIFY & MERGE for programs and separate data files.
- Sinclair 16K extended BASIC – incorporating unique 'one-touch' keyword entry, syntax check, and report codes.

ctrum

## The ZX Printer – available now

Designed exclusively for use with the Sinclair ZX range of computers, the printer offers ZX Spectrum owners the full ASCII character set – including lower-case characters and high-resolution graphics.

A special feature is COPY which prints out exactly what is on the whole TV screen without the need for further instructions. Printing speed is 50 characters per second, with 32 characters per line and 9 lines per vertical inch.

The ZX Printer connects to the rear of your ZX Spectrum. A roll of paper (65ft long and 4in wide) is supplied, along with full instructions. Further supplies of paper are available in packs of five rolls.

## The ZX Microdrive – coming soon

The new Microdrives, designed especially for the ZX Spectrum, are set to change the face of personal computing by providing mass on-line storage.

Each Microdrive can hold up to 100K bytes using a single interchangeable storage medium.

The transfer rate is 16K bytes per second, with an average access time of 3.5 seconds. And you'll be able to connect up to 8 Microdrives to your Spectrum via the ZX Expansion Module.

A remarkable breakthrough at a remarkable price. The Microdrives will be available in the early part of 1983 for around £50.

## How to order your ZX Spectrum

BY PHONE – Access, Barclaycard or Trustcard holders can call 01-200 0200 for personal attention 24 hours a day, every day. BY FREEPOST – use the no-stamp needed coupon below. You can pay by cheque, postal order, Barclaycard, Access or Trustcard.

EITHER WAY – please allow up to 28 days for delivery. And there's a 14-day money-back option, of course. We want you to be satisfied beyond doubt – and we have no doubt that you will be.

**To: Sinclair Research, FREEPOST, Camberley, Surrey, GU15 3BR.** **Order**

| Qty | Item | Code | Item Price £ | Total £ |

**FREEPOST – no stamp needed.** **Prices apply to UK only.** **Export prices on application.**

## ZX Spectrum software on cassettes – available now

The Spectrum software library is growing every day. Subjects include games, education, and business/household management. Flight Simulation...Chess...Planetoids...History...Inventions...VU-CALC...VU-3D...Club Record Controller...there is something for everyone. And they all make full use of the Spectrum's colour, sound, and graphics capabilities. You'll receive a detailed catalogue with your Spectrum.

## ZX Expansion Module

This module incorporates the three functions of Microdrive controller, local area network, and RS232 interface. Connect it to your Spectrum and you can control up to eight Microdrives, communicate with other computers, and drive a wide range of printers.

The potential is enormous, and the module will be available in the early part of 1983 for around £30.

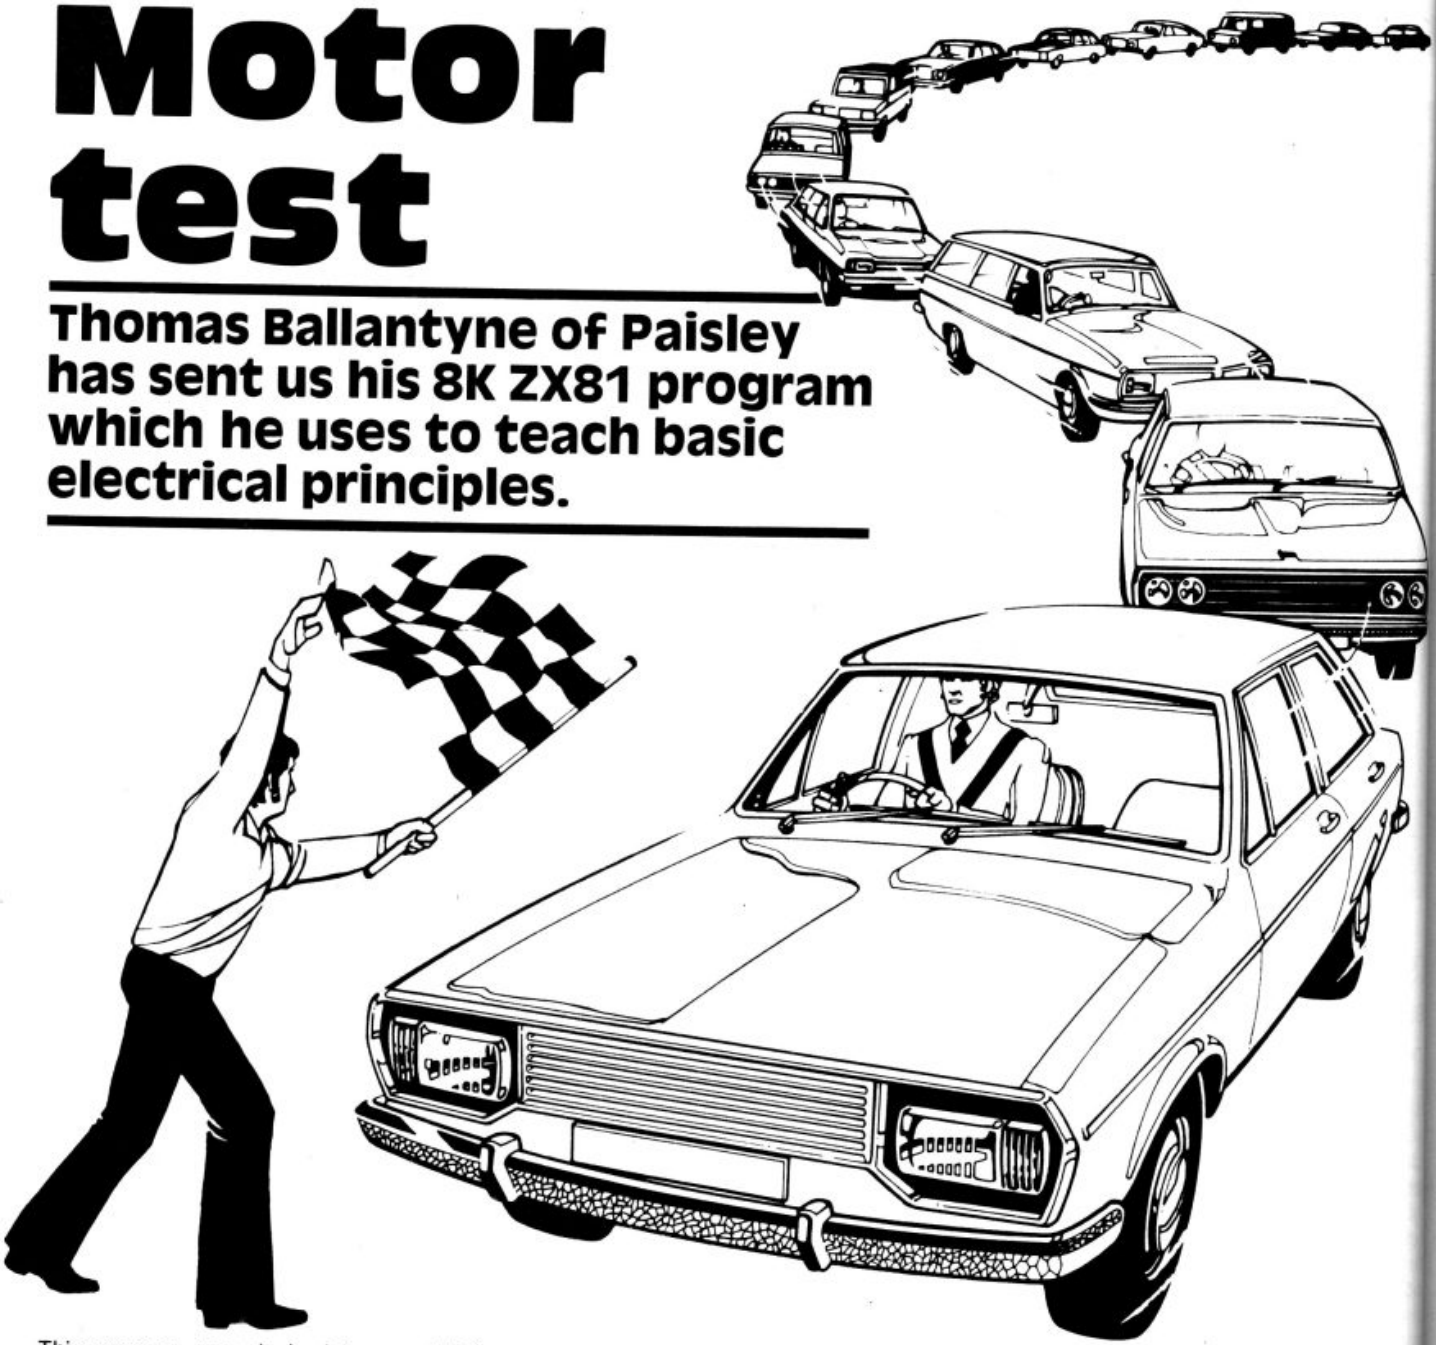
# Motor test

**Thomas Ballantyne of Paisley has sent us his 8K ZX81 program which he uses to teach basic electrical principles.**



This program was devised to simulate the electrical conditions which occur when a single phase AC motor is in operation.

The first section of the program draws a circuit diagram which represents the motor connected to an electrical supply, with instruments in circuit to measure current, voltage and the input power. Readings of these values and also of the power output of the motor are shown in the diagram. These values appear when the motor is operated.

Since the program is used in the teaching of basic electrical principles, it now asks you to enter the values of four quantities. These are:

(a) The motor efficiency.
(b) The motor power factor.
(c) The input Volt Amperes.
(d) The reactive power.

Information can be obtained from the program in order to devise a solution to these problems. If you want to delve a bit more deeply into the electrical theory involved, then an electrical text book must be consulted.

A teaching program should be designed to correct wrong answers. Entry of a wrong answer causes the program to display how the correct one should be obtained. A further entry of a wrong answer causes the correct solution, and the method of achieving it to appear.

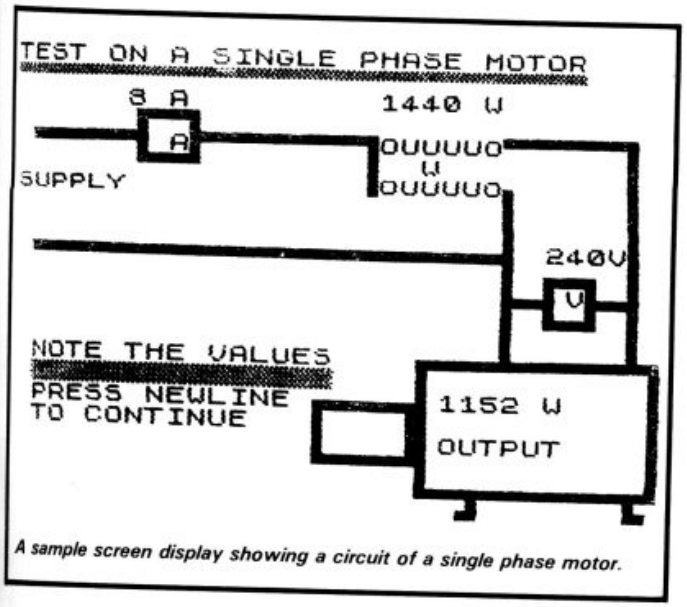
The motor takes a random current of between 1 and 10 Amperes. The supply voltage is constant at 240V. This voltage is chosen because it is the standard value of the single phase supply in this country. The current is limited to simulate practical conditions; if the voltage was to be higher, then a three phase system of supply would have to be used.

## Motor ways

Lines 10 to 980 print the diagram and set the variables. If a different voltage, say 110V, is required, simply alter line 750.

When the program is run, lines 1000 to 1130 generate the questions to be answered, and the methods to be used. The remainder of the program is devoted to displaying the answers entered and to showing the user how to correct them, if necessary.

There is no way round the fact that a program of this type is rather long (this one takes about 8K) as every eventuality must be catered for. The disadvantage of any teaching program is the amount of memory that is used. Once it is made up, however, it can be used over and over again. It often also forms the basis for a new program at a later time.



*A sample screen display showing a circuit of a single phase motor.*

# In search of adventure

**Now that the Christmas rush is over, Paul Holmes takes a look at some of the latest software for the ZX Spectrum.**

I expect that by now you are as sick of turkey sandwiches and Christmas cake as I am, and are now on the lookout for some post-festive inspiration for your ZX Spectrum. Whether you managed to survive the Christmas period with some cash or you are wondering what to do with that fiver you received from your Auntie, here are a number of goodies to choose from.

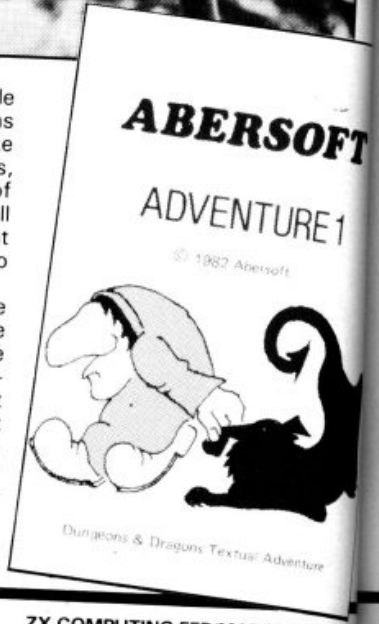
## Adventure 1 — Abersoft

This is an adventure game, and for the uninitiated an adventure game is one of a 'search' usually for treasure of some description hidden in caves, passages, jungles, Egyptian pyramids and the like. Just to make matters more complicated, there are usually a number of monsters and mysterious objects whose sole aim in life is to hinder or help you on your quest.

Abersoft's adventure, however, has no harmful monsters but makes you rely on your own intelligence to get around the passages and utilise the objects you find to help you win the treasure. In the first scene, you are looking at a water house and you can see a large set of keys, a shiny brass lamp, some tasty food and a bottle of water. You can instruct the computer by giving it simple one or two word instructions such as 'get keys' or 'take lamp'. Using these keywords, you can pick up a number of items that you might think will be of use to you at a later point in the game; you are allowed to 'hold' up to eight items.

To find out what you are holding at any stage in the game, you type 'inventory'; the computer's recognition of vocabulary is very good, and fast too due to the fact that the vast majority of the program is written in machine code. The computer only scans the first four letters of each keyword so 'inve' is the same as 'inventory'.

To move about in the game,



simple compass directions should be given such as 'N', 'E', 'S' and 'W'. Instructions such as 'enter' are obeyed such that if you are next to a building or the entrance to a passage, you will appear inside.

## A 'smashing' game

The adventure is based on a series of caves, canyon crawls and passages. There are countless rooms with a white mist lingering on the floor (similar to a Top of the Pops rehearsal, maybe?). Most passages, rooms, etc, are empty but some will contain useful objects and treasure. The treasure varies from extremely heavy golden nuggets to easily breakable Ming vases.

The Ming vase had me in some confusion for a few days (don't get the idea that you'll manage to finish this game in a week!). The problem with the vase is that the only way to put something down is to use the command 'drop' which is countered with the reply 'you hurled it delicately to the ground'. (You have to put some of the objects down again as for every item of treasure you return to the water house, you receive 10 points.) So all I got the first few times I tried this was a smashed vase! Until I found the pillow, of course...

There are 21 items of treasure to find in the game in all, so don't expect an easy time. The adventure holds many secrets for the player to work out, one of which is the meaning of the secret messages on the walls in certain rooms. I managed to work out most of them, but I won't spoil your fun by telling you.

## Lack of talent?

At one point in the game I came across a very strange room in which I was standing at a window looking down on a pit (complete with mist). Opposite me I could see a man at another window waving back at me. It has been a puzzle to me ever since — what is the relevance of the eerie figure? Perhaps he was, like me, another player driven to madness by this game.

I fear he might have been, as the game is non-graphical and requires great enthusiasm to play for more than a few hours at a stretch. Pure text, with no colour or sound, is a clear waste of the ZX Spectrum's talent and would clearly wear the interest of the player. (There is also a ZX81 version of the game available for £8.95.)

Far too often in the game, I found myself going round and round in circles. However, there's no resting to cook the odd meal or read a book or two while you await some happening — the computer always has a quick answer for you. For instance, in the depth of frustration, I told the computer 'where to go' to which it promptly told me 'Watch it. The wizard is watching you'. I found its understanding of my use of 'non-Queen's English' quite amusing and prompts me to applaud the author's sense of humour.

One of my main criticisms of the game is the actual quality of the cassettes themselves. One of the two copies I had for review had a header that was full of rubbish, so that the normally tolerant Spectrum rejected it. The whole program was littered with clicks and buzzes. However, I did manage to load the second copy, albeit with some difficulty.

Adventure is priced at £9.95 and is available from Abersoft, 7 Maes Afallen, Bow Street, Dyfed SY24 5BA.

## Superview / Superdraw — Video Software

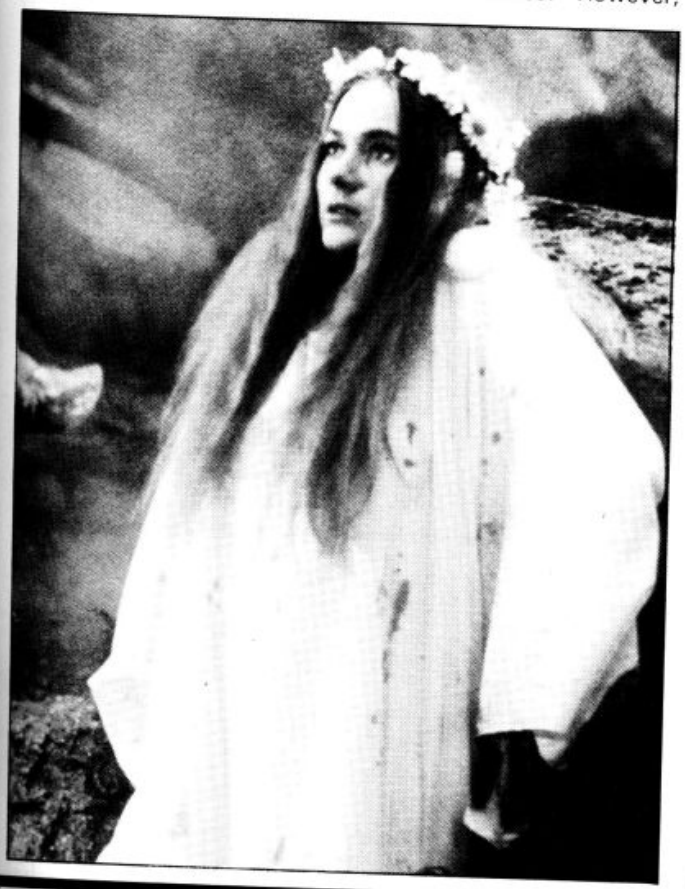
Video Software are now selling

```
You are standing at the end of a
road before a small brick
building. Around you is a
forest. A small stream flows
out of the building and down a
gully.

enter

You are inside a building, a
well house for a large spring.
About you can be seen
A large set of keys
A shiny brass lamp
Some tasty food
A bottle of water
```

```
You are at one end of a vast
hall stretching forward out of
sight to the west . There are
openings to either side .
Nearby, a wide stone staircase
leads downward. The hall is
filled with wisps of white mist
swaying to and fro almost as if
alive. A cold wind blows up the
staircase. There is a passage
at the top of a dome behind you.
About you can be seen
Rough stone steps leading up
gargle
I don't understand.
```



```
You can't get by the snake.

You are in the hall of the
mountain king, with passages off
in all directions.
About you can be seen
An aroused,huge,green snake,
barring the way
sing
No.I have a terrible voice

kill
Don't be ridiculous
```

# JOIN THE USERS' CLUB

FREE BOOK!

**Make the most of your Spectrum or ZX81 by joining the country's strongest and most enthusiastic users' club–the National ZX Users' Club.**

When you join us, we'll send you our 'new members welcome pack' with 30 programs (15 for the ZX81, 15 for the Spectrum), plus the first issue of our value-packed club magazine INTERFACE.

Inside INTERFACE as well as at least six programs for your ZX81 or Spectrum, you'll find letters from members as they share tips and ideas, and sound off on a variety of subjects (such as you-know-who's appalling delivery times record), a list of local ZX clubs, and special offers from software houses and book publishers–special offers just for members.
If you're having problems with your computer, we have experts on tap to try and help you. If you want to start a local users' club, we'll give you publicity, and let you buy books at a special discount for your club members.
If you're not a club member, you're missing out on making the most of your micro (and try saying that ten times quickly!)
Come on in and join us, the water's fine. It's £9.50 for a year's INTERFACE, and we'll send you a sample issue for £1.00

Run by Tim Hartnell, the National ZX Users' Club is a resource just waiting to be tapped. Come on and start tapping.

National ZX Users' Club,
Dept. **ZC**
44-46 Earls Court Road,
London, W8 6EJ

OK, Tim, you've convinced me:

( ) Send me my 'new members' welcome pack' plus my first issue of INTERFACE and keep those INTERFACES coming for the next year. I enclose £9.50 (UK), £12.50 (Europe)

( ) Just send me a sample of INTERFACE. I enclose £1.00

I have ( ) a ZX81 ( ) a Spectrum

Name .....

Address .....

.....

two 'creative' packages for the 48K ZX Spectrum. The first is a text display and creating system called Superview.

Superview has two options: 42 pages of two colour text or 21 pages of eight colour text. These two options provide sensibly an optional trade-off between colour and space. The only thing that disappointed me was the waste of space in the colour storage methods. The most space saving system would have been to insert colour codes into the text wherever there was a change of INK, PAPER intensity and its FLASH mode. Instead, they have taken the option to store an individual attribute for each character, which is unnecessary. If they had taken the more efficient option, the storage size could have been doubled.

Superview is supplied on cassette, complete with a reasonable little manual held together by ring binders. Complementing the manual is a new concept of having a written commentary on the reverse side of the cassette. This is quite a good idea and should clearly be an indication to other manufacturers of software packages requiring good documentation.

## What's on the menu?

On the tape, a demo set of 21 full colour pages are provided which can be loaded using Superview's 'Load a set of pages by name' option. These pages depict the history of computers and effectively show off the capabilities of good coloured text.

Superview operates via a menu which allows you to save and load pages, view pages in sequence, view pages on demand (in a similar way to Teletext and Prestel) and to create a new set of pages or alter the existing ones. To create a new set of pages, one must first destroy the existing ones leaving room for the new set. The pages are stored quite simply in character arrays and recalled to the screen using a very clever method. First of all, the screen attributes are set set to white so that the machine prints white characters onto a white background. Then, once a whole 'invisible' page has been printed, the attributes are transferred by machine code from an array to the attribute file. In this way the text appears to instantly arrive on the screen.

This program would be very useful to the shop owner who could set up some product information for his or her customers to inspect at their leisure. Overall, I was impressed.

## Luck of the draw?

Superdraw is similar to Superview in that it is for visual creation, but Superdraw is for creating Hi-Res graphics. It too is based around a main menu and uses a similar programming style to its sister package.

In the drawing mode, full eight way cursor control is allowed along with a number of necessary functions to alter the colour, brightness, etc. Again, like Superview, there is a commentary on the reverse side of the cassette and the package is supplied with a ring bound manual which provides a full explanation of the system.

The loading problems with this tape were really very serious. I tried to get the program loaded using a 'new-fangled' graphic equaliser, but even then failed to get it into the machine. Because of this I am certainly not in a position to say whether or not you should buy this program. The best thing to do if you are interested in this particular tape is to arrange for some form of demonstration so that you can actually see it loaded into the machine.

Superview and Superdraw are priced £5.00 and are available from Video Software, Stone Lane, Kinver, Stourbridge, West Midlands DY7 6EQ.

```
SUPERVIEW  MENU OF OPTIONS

1.  Clear or copy a page.

2.  Load a single page by name
3.  Load a set of pages by name.

4.  Save a single page by name.
5.  Save a set of pages by name.

6.  View pages on demand.
7.  View pages in sequence.

8.  Create/amend a page.
9.  Create a new set of pages
```

# Purchase/sales ledger

## Neil Streeter of Hastings decided to save himself some money – instead of buying a commercial purchase/sales ledger package, he thought he'd write one of his own!

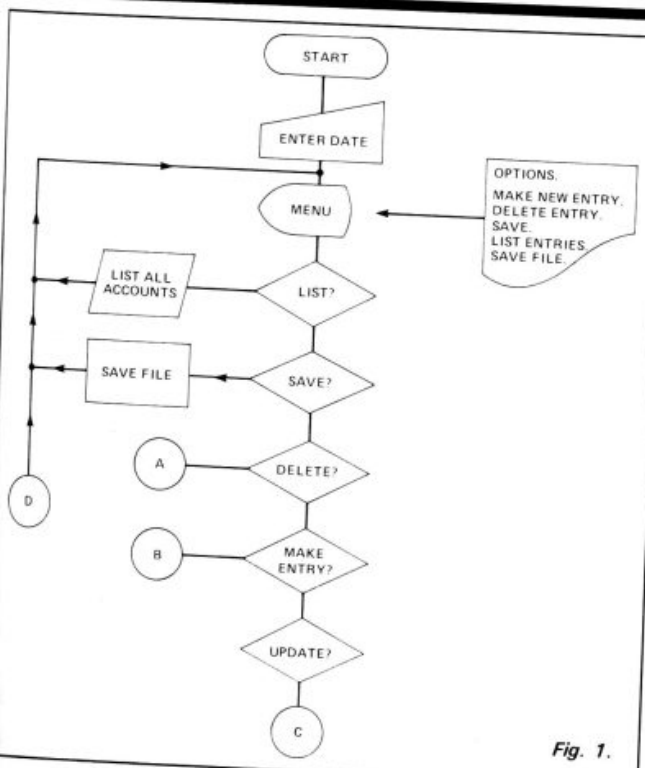


*Fig. 1.*

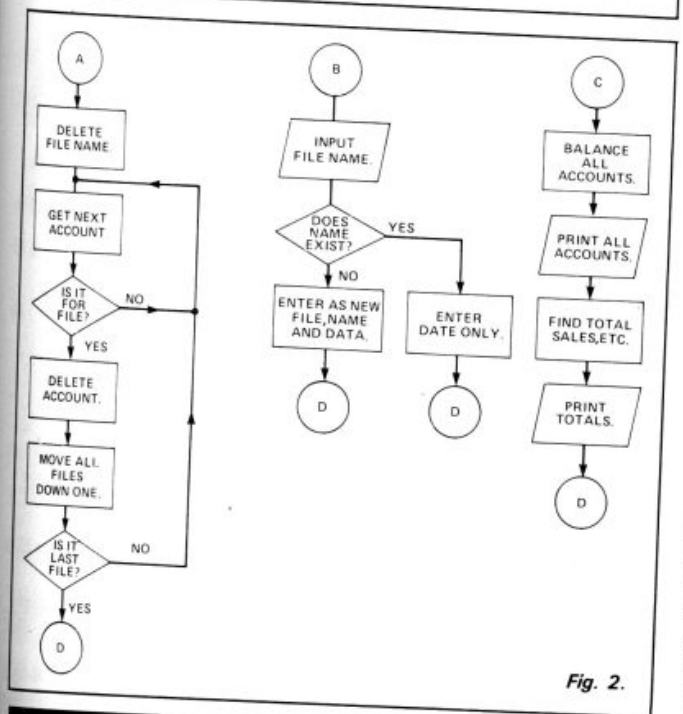

*Fig. 2.*

I recently became interested in getting hold of an accountancy package for my ZX81, especially those including purchase and sales ledger programs. However, the cost of these was slightly too high for my expenses (I am a bit of a miser I suppose). So, I decided to have a go at writing them myself. As the prices of these programs are in the range of £8-17, I had every reason to believe that this would be a difficult task as usually the more expensive programs reflect the complexity of the programming involved.

However, I did have one thing in my favour – I had studied basic accountancy while at the University of Aston in Birmingham, and I still had all my old text books. So I rescued them from their hiding place and, having dusted them off, looked through the indexes for a purchase and sales ledger.

I was amazed to find that it would not be as difficult as I had first imagined. One program would serve as the central core for both, with only minor alterations needed between the two. Basically (no pun intended), they consist of a number of files, each containing information on a sale or a purchase. At certain times, these accounts would have to be balanced and updated.

First things first though – I decided to draw up a series of flow charts to simulate exactly what the final program should do. These are shown in Figs. 1 and 2.

### Setting up

Then, I set about the programming. My first decision involved the kind of format I was going to store the data in. I toyed with several ideas such as packed free, packed fixed, etc, until I decided to use a combination of the first two methods I found.

There would be two string arrays: the first would contain all the account names and the second, all the data. The first array was easy and just needed dimensioning. The second array required a packed fixed format – packed because the data was packed tightly and fixed because each piece of data always occupies the same number of bytes. The format for each string in the array is shown in Fig. 3.

AN was chosen to represent the account number. This would be a character, the code of which is the reference to the array of account names. VAT would be either the character I or E, depending on whether it was to represent 'inclusive' or 'exclusive'.

Thus, having worked out my format, flow diagrams and reference material, I set to the task of writing a program to fulfil my needs. It was finished after approximately seven hours work.

The program is quite straightforward to use and has space for 50 accounts and up to 300 entries. If you have less accounts you may alter the arrays to suit your requirements. The program listing as it stands is for the purchase ledger, but only six lines need be altered to magically transform it into a sales ledger. Two programs for the price of one – pretty good, eh?

I'm not saying that this program is as good as a commercial ▶

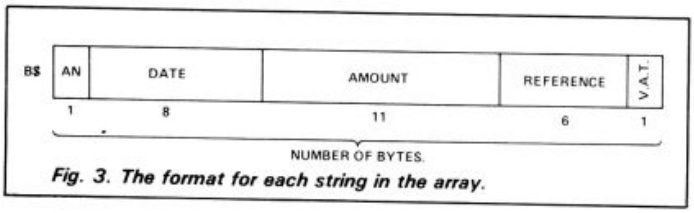

*Fig. 3. The format for each string in the array.*

package, but it does do the job and it's fairly fast too. Which may present a moral – just because the price is high, it doesn't mean you can't write it yourself.

## Operation

The program, like all good business programs, is menu driven and extremely user friendly. It should be evident how to use the program as soon as you have it up and running.

However, when I set it up for the first time, I do the following. RUN the program, which should give you a date request on the screen. Then, EDIT and STOP, followed by Newline to break into the program. Now, enter:

LET DS(I) = "00:00:00"

as a direct command. Follow this with GOTO 1000 as a direct command.

You will now be requested to enter the date again which you should do and you will get the menu. You may now select the SAVE option and save the program either as a sales ledger or as a purchase ledger. This means that your program will automatically start on loading with the first date as 00:00:00.

# ZX81 GAMES

from

## J.K. GREYE SOFTWARE LTD

THE NEW GENERATION SOFTWARE HOUSE

*"Without question the finest machine code games available today."*..... J.N. ROWLAND Product Manager for W.H. SMITH.

**GAMESTAPE 1 for 1K** _____ **only £3.95**
10 Games incl. ASTEROIDS, UFO, CODE, BOMBER, GUILLOTINE, KALEIDESCOPE, etc.
**PROBABLY THE BEST VALUE 1k TAPE AVAILABLE.**

We've done in 1k, games which some of our competitors require 16k to do!

**GAMESTAPE 2 for 16K** _____ **only £3.95**
***STARFIGHTER** Superb machine code Space Battle. Set against a background of twinkling stars, with stunning explosions — if you can hit the enemy!
**PYRAMID** Can you move the Pyramid? Make a mistake and it will collapse! A Thinkers game.
**ARTIST** The ultimate Graphic Designers aid. 8 Directions, 10 Memories, SAVE, COPY, RUBOUT, CLS, etc.

**GAMESTAPE 3 for 16K** _____ **only £4.95**
***CATACOMBS** A Multi-Level Graphics Adventure. Each level can contain up to 9 Rooms, 8 Passages, 7 Monsters, Food, Gold, Traps, Phantoms, an Exit (to the next level), and there's an infinite number of levels.
NOTE. . . . This is NOT one of the necessarily limited text Adventures as sold elsewhere.
*"An excellent addictive game which will keep you amused for hours."*. . . . *COMPUTER & VIDEO GAMES.*

**GAMESTAPE 4 for 16K** _____ **only £4.95**
***3D MONSTER MAZE** The Game to Top All Others. Unbelievable Graphics! Can you find your way through the Maze? The EXIT is there somewhere, but then so is a T.REX, and its after YOU! All in 3D (the T.REX will actually run towards you in full perspective!), you've never seen anything like this before!
*"3D MONSTER MAZE is the best game I have seen for the ZX81"* . . . COMPUTER & VIDEO GAMES
*"If I had to choose just one programme to impress an audience with the capabilities of the ZX81, then J.K. Greye's 3D MONSTER MAZE would be the one without doubt"* . . . . ZX COMPUTING. *"Brilliant, brilliant, brilliant!"*. . . . *POPULAR COMPUTING WEEKLY*

**GAMESTAPE 5 for 16K** _____ **only £4.95**
***3D DEFENDER** The Ultimate Space Game. Super fast Machine Code 3D version of the Arcade favourite. You have to save your home planet from the marauding Alien Spacecraft. This is all in 3D, your viewscreen shows you the view out of your fighters cockpit window. The backdrop moves when you turn, or fly up or down (8 flight directions), just as if you were really flying it! But then YOU ARE! The Enemy Saucers will actually zoom towards you in 3D, and shoot you if you let them! Your display includes Score, Shield Strength, Altitude, Proximity, Forward Radar and your viewscreen, which shows your rotating home planet, backdrop of Stars, Meteors, Explosions, Plasma Blasts, your Photon Beams, up to 4 Enemy Saucers and of course its all in full 3D!
*"Another 3D winner"*. . . . . *SINCLAIR USER*

**GAMESTAPE 6 for 1K** _____ **only £1.95**
***BREAKOUT** Super Fast Full Screen Display Game. Your all time favourite with an added twist. See how much Money you can win and watch the pounds convert to Dollars. All in Machine Code for Fast Action with 3 Speeds, 2 Bat Sizes and three angles of rebound! The best BREAKOUT around and at this price you can't go wrong!
*"The best of its kind"* . . . . . *WHICH MICRO & SOFTWARE REVIEW*

GAMES MARKED * INCL. MACHINE CODE.

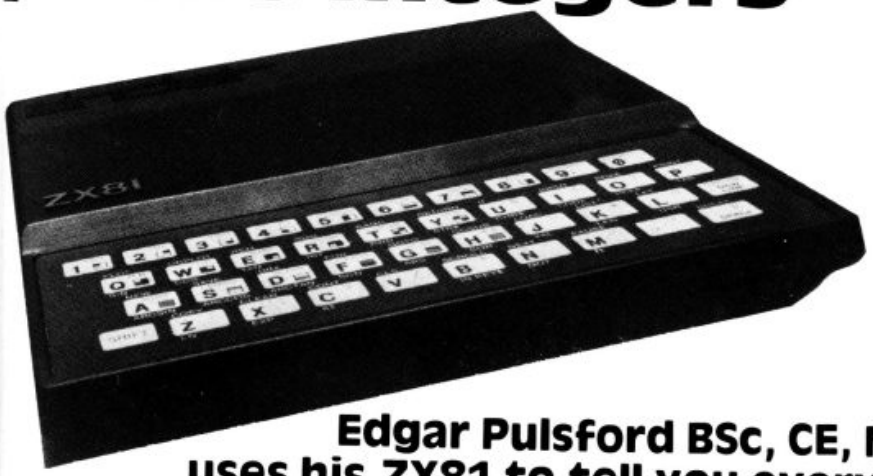
# On the density of prime integers



**Edgar Pulsford BSc, CE, MIERE,**

**uses his ZX81 to tell you everything you ever wanted to know about prime integers . . . but were afraid to ask.**

A computer is programmed to identify and count the primes in a range of consecutive integers centred on a power of 10, eg from 9,500 to 10,500. The proportion of primes in the range is calculated for each decade from 10 to $10^9$.

If the proportion of primes in the integers of the range is termed the *density* of primes, then it is found that:

*The product of the density of primes and the natural logarithm of the central integer of the range appears to be unity.*

or:

*The mean spacing of primes about N equals $\log_e N$.*

These results have irregularities because of the non-uniform spacing of the primes. Also, the number of integers in the range is small compared to the magnitude of the central integer, and yet large enough to reduce statistical errors to minor importance.

All integers are positive, and primes are those with no factors other than themselves and unity. The principal symbols involved with the density of prime integers are given below.

X — Lower bound of range.
Y — Upper bound of range.
W — Width of range = (X − Y) consecutive integers.
N — Central integer of the range = (X + Y)/2.
P — Number of primes in the range.
R — Proportion (or density) of primes = P/W.
ln N — Natural logarithm of N.

The empirical result in symbols can be seen in the equation below.

$R \times \ln N = 1$

## Counting of primes

This work was prompted by a program published in *ZX Computing*, Vol. 1, No. 1, page 29, which program was modified to give a serial number to each prime. This proved to be the important factor for what follows resulting in the primes being considered as a definite class of integers, little notice being taken of their values. The study became one of the density of primes in the integers, particularly with relation to the position in the integers where the density was measured.

The modified program referred to is given in Fig. 1. Figure 2 gives the result of printing out every hundredth prime, and also shows the ratio of the prime to its serial number. Figure 3 shows a graph of this ratio against its serial number. The shape of this curve has not been studied, but the fact that it was a smooth curve indicated that there was some relationship worthy of further investigation.

It was then decided to study small regions of the integers, finding the proportion of primes in each region, and relating this to the magnitude of the central integer. For example, in the region 500 to 1,500, 144 primes were found. The proportion is therefore 144/1,000 or 0.144, which was related to 1,000, the central integer between 500 and 1,000. A measurement of this kind was made, using the program of Fig. 4, at each decade from 10 to $10^9$, which is about as far as the ZX81 will conveniently go.

The principles involved are:
(a) Integers of the series $6M \pm 1$ are chosen for testing. It may be seen that this series contains all the primes, although all numbers of this series are not primes. Seeing that $6M \pm 1$ and $6M \pm 3$ represent all the odd integers (but $6M \pm 3$ are composite, being divisible by 3) it follows that $6M \pm 1$ contains all the integers which might be primes.

The program starts with a trial integer of the form $6M - 1$ near the lower bound of the region of interest, tests it, adds two, tests the number so formed, then adds four and tests that, and so on, counting the primes as they are found.
(b) The divisors (D) used for the tests start at three, and each time a new divisor is needed, two is added to the D just used so that all the odd integers are used in turn. There is no point in using even integers.
(c) The composite nature of the number under test is detected by:

550 IF N/D − INT(N/D) = 0, etc

If this is true then N/D is an integer and equal to INT (N/D). Successive values of D are tried and if the above is found to be true, then the next N is formed and the testing resumed.
(d) The primality of the tested number is detected by limiting the value of D to a maximum equal to the square root of N. If no divisor is found up to this value, then N is prime. Steps are taken to count and record (if desired) the prime so found, and then the next number for trial is formed and tested for primality or compositeness.

A program devised to do this is given in Fig. 4. The work stops when N is greater than the upper bound of the chosen region. Typical results are printed out in Fig. 4a and fuller results are tabulated in Table 1.

A new region is then chosen, typically one decade greater, and the work continued. Because of the slowness of the testing when N is large, say greater than $10^6$, it is convenient to reduce the number of primes counted at any particular decade, and to accept a worsening of statistical accuracy.

## Treatment of results

As the observations were made on regions one decade apart, it seemed convenient to plot (manually) R against $\log_{10} N$. Figure 5 is the result. Although at first, the base 10 was used, later it became apparent that the natural base, e, was to be preferred. The plot of R against ln N is therefore shown.

The shape of this curve prompted examination to see if it were an exponential or a rectangular hyperbola. It was soon found that it was a good fit to the equation:

$X \times Y$ is a near constant.

If the product of R and ln N are formed, it is seen that they are not only near constant, but that constant is near unity. Thus, the empirical relation:

$R \times \ln N = 1$ (approximately)

is obtained, where N extends over the range from 10 to $10^9$.

This result has the quality of being mathematically simple, which is satisfying. But it is possible to go a stage further. R × ln N may be written:

$\ln N^R$ or $\ln N^{P/W}$

and either of these equivalent expressions may be equated to unity (approx).

And since the number whose ▶

natural logarithm is unity is e, or exp, it is possible to write:

$N^{P/W} = e$

where e is equal to 2.718

## Statement of the result

If there are P primes in a region W of the natural integers of which the central integer is N, then, if R = P/W,

$R \times \ln N = 1$ or $N^{P/W} = e$

The accuracy and 'constancy' of $R \times \ln N$ is shown in Table 1. The effects of the statistics of sampling have been taken into account only insofar as a reasonable sample size for P has been aimed at, consistent with the time available for the work.

## Testing the relationship

Having made the observations and developed the relationship, it remains to test it to see if it can be used to forecast new information.

A test program was written in which a series of Ns from $3.2 \times 10^2$ to $3.2 \times 10^8$ were chosen. These may be thought of as the half-points of decades because log 3.2 is about 0.5. For each of these Ns, the value of W which was expected to contain 75 primes was calculated and the computer set to count the actual number in this W, the result being compared to the expectation. The program and results are given in Fig. 6 and Table 2 (test results). It will be seen that there is a good agreement between measurement and expectation.

Material for tests is also found in the results of the first experiment, Figs. 1 and 2. The empirical relationship can be used to calculate the number of primes expected and to compare the results with 100. This was done and is shown in the results of the program in Fig. 7. The results are fairly consistant with expectations, but this is only a small range over which to do the test. The figures are included for interest; their mean is 100.8. It is considered that they support the empirical relationship.

## Various observations

The program of Fig. 4 is so designed that it is essential that the first integer in the range W offered for test is of the form $6M - 1$. To ensure this, when the value X of the lower bound has been found, the starting integer for the test, X', is found using:

$X' = 6 \times \text{INT}(X/6) - 1$

INT (X/6) gives the value of M, and then the expression gives an integer which is a few units only away from the value of the lower bound, X.

The value of the upper bound, Y, is used without modification for ending the search.

For the larger Ns the computing takes a long time, even in Fast mode. Reducing the number of primes has been used to shorten the work but continuous running day and night has been neccessary. If the scope of this work is to be extended, a faster working and larger number-handling computer will be needed.

The region about $10^7$ produced anomalies, suggesting that there is a scarcity of primes there. This needs looking into. It is known that there are regions where there are long successions of composites (see text books on Theory of Numbers)

| N | W | P | R=P/W | ln N | $R \times \ln N$ | $N^{P/W}$ e = 2.718 |

*Table 2. The results obtained from the program given in Fig. 6.*

but this region has not yet been examined. Extending W, or shifting a little way from $10^7$ gives results more in line with the general findings of this work. For completeness several results in this region are included in Table 3.

The number of significant figures retained in the tables is thought to be not inconsistant with the experimental results. Programming devices were used to reduce many results to three significant figures.

A machine plot of the results of the first experiment was made, but because of the coarseness of PLOT it shows irregularities which are absent from the manual plot.

It is known that primes sometimes occur in pairs, both 6M − 1 and 6M + 1 being prime. Examples are 11,13; 17,19; 29,31; etc. These pairs were noticed at all stages of the present work. It is known that pairs become rarer as N becomes larger, so a program was devised to count pairs at various decades of N. Beyond supporting this statement, no other information about them was noticed, but the density of prime pairs might make the subject of a study arising out of the work described here.

It follows that ln N is the mean spacing of primes in the vicinity of N.

## Conclusion

It is thought that new light may have been shed on the subject of the density of primes in the set of ordered integers. So far no reference has been found to work of this kind in the few books I have read. However, there is a reference in **Numbers**, by L. F. Taylor (Faber) p. 81, to work done in 1896, which gave the number of primes (Px) less than a given integer x, as in x/ln X as x tends to infinity, but this does not seem the same as the result here described.

Further developments must be left to more skilled mathemeticians and computer programmers than the present author is ever likely to be.

# Push your Sinclair to the limit

## ZX81/SPECTRUM ARCADE GAMES

NEW **ZX INVASION FORCE** (ZX81)
Use your skill to fire through the energy band to destroy the menacing alien ship — **£3.95**

NEW **SPEC INVADERS**
**SPEC GOBBLEMAN**
These exciting high-speed classic games incorporate hi-resolutiongraphics and sound to bring you the best in arcade action at only **£4.95** each (16/48K)

NEW **SPEC FROG 5/SHOWDOWN** (16/48K)
Hop across the dangerous road avoiding the lethal cars, then lorries. Go back to the wild west for a gunfight battle amongst cacti and wagons. Features include western music. **£4.95**

NEW **NAMTIR RAIDERS** (ZX81)
High speed, quick action arcade game with four separate groups of attackers. **£3.95**

Gobbleman also available for ZX81 at **£3.95**

## UTILITIES

NEW **TOOLKIT**
Nine powerful new functions for your ZX81 (including re-number lines (goto, gosub), program merge, string finding and replacement. **£5.95**

**SPEC BUG**
A 30 in 1 machine code tool and disassembler for your ZX Spectrum. **£6.95**

**ZX BUG**
A 30 in 1 machine code tool and disassembler for your ZX81. **£6.95**

## Improve your machine code programs with this new 48K Spectrum Assembler

Just released by Artic, this new professional quality assembler is also available for 16K ZX81 and features:—

* Word-processor-like text editor. * High-speed, versatile two-pass mnemonic assembler with labels and detailed error-trapping. Will assemble to any address. * Essential support facilities such as memory-edit, register inspect/modify and search for de-bugging. * Full output to ZX-printer. * Memory-status report and comprehensive user-manual.

ONLY £9.95

**ZX81 & SPECTRUM**

## ADVENTURE GAMES

JUST RELEASED for 48K SPECTRUM
Still available for ZX81

**INCA CURSE** (Adventure B)
In a jungle clearing you come across an ancient Inca temple. Your mission to enter, collect the treasure and escape alive. But beware!
Includes a cassette save routine. **£6.00**

**SHIP OF DOOM** (Adventure C)
You are unavoidably drawn to an alien cruiser. Can you reach the control room and free yourself? Or will they get you first? Includes a cassette save routine. **£7.00**

**ESPIONAGE ISLAND** (Adventure D)
While on a reconnaisance mission your plane loses control and you are forced to land. Can you survive and escape with the island's hidden secret? **£8.00**

**PLANET OF DEATH** (Adventure A) 16/48K
You find yourself stranded on an inhabited alien planet. Can you reach your ship and escape? **£5.00**

REDUCED TO £29.95

**ZX FORTH**
Supplied on cassette with editor cassette, user manuals and keyboard overlay. ZX Forth combines the simplicity of basic with the speed of machine code

## THE ULTIMATE ADVENTURE FOR THE SPECTRUM/ZX81 for only £9.95

AND THE CHANCE TO WIN **£10,000** or more IF YOU

**KRAKIT™**

KRAKIT TRADE MARK OF INT. PUBLISHING & SOFTWARE INC.

RULES AVAILABLE FROM ARTIC

Your eccentric father has left you £10,000 in his will. In order to claim your windfall you must solve twelve clues and gain access to a bank account in which the money has actually been deposited. Be the first to crack the puzzle and the prize is yours! Plus you will win two tickets to the city of the secret KRAKIT™ vault location. The prize money is increased weekly. A telephone number will be supplied so you have the opportunity to find out just how much you could win.

**DON'T MISS YOUR CHANCE TO WIN A FORTUNE!**

## A GREAT CHESS GAME FOR YOUR ZX81 OR SPECTRUM*

*SPECTRUM CHESS 48K

**ZX CHESS I**
Very popular machine code program, with six levels of play and an analysis option. Available for ZX81. **£6.50**

**ZX CHESS II**
A new improved version, with a faster response time, seven levels of play, analysis option and in addition a recommended move option. **£9.95**

**ZX 1K CHESS**
An incredible game in 1K for only **£2.95**
As featured on ITV

NEW **SPECTRUM VOICE CHESS**
This incredible program talks you through your game.
It tells you its move, recommends a move, and contains a range of facetious comments. The game is based on the highly successful ZX Chess II and is offered at the Christmas offer price of **£9.95.**

**SPECTRUM CHESS** now only **£9.45**

## ALWAYS AHEAD WITH ZX81/SPECTRUM SOFTWARE

Cheques & P.O. made payable to: Artic Computing Limited. Dealer enquiries welcome.

# What can I do with 1K

**You may think 1K of memory is not enough to do anything useful. Roger Valentine shows you that 1K is more than enough if you program efficiently.**

There has been a tendancy of late for computer memory sizes to go literally 'through the roof'. In olden days (and remember that in computer terms, the 'olden days' were only two or three years ago!), the largest possible memory size for an eight-bit microcomputer was 64K. Only a very few exclusively business machines actually achieved this maximum; the largest PET was 32K, the Apple was 48K and the Sinclair ZX80 was (theoretically) expandable up to 16K, although many ZX80 users either did not expand beyond 1K at all, or were content with the smaller 4K RAM extension. But look at the situation today – the latest 'Superpet' is available with 256K of RAM; the Sinclair Spectrum can have 48K 'on board' as standard; even the 'small' Spectrum is as large as the 'fully expanded' ZX81 (16K). And the ZX81 itself? Well, there is the 64K 'Memopack', and I believe (although I haven't actually seen this personally) there is a 128K RAM extension on the market. Sinclair's own 16K RAM Pack has been reduced in price, and any number of alternative 16K RAMs are now available.

## What's in store?

If you are still working with 1K, you may well get the impression that you are becoming a 'second class citizen' in the computer world! Is there any point in even *trying* to squeeze in anything worthwhile, or should you join the rest in the Great RAM Race?

The answer, I firmly believe, is *yes*, you should persevere, and *no*, you should not expand, *until* you have learnt how to make the most of every single one of your 1,024 bytes. Let's face it, most people buy a ZX81 to *learn* about computing, and there are lessons to be learnt about *efficient* and *concise* programming which even the so-called experts have never realised. Computer programs are like gases – they tend to expand to fill the amount of space available to them (Valentine's first law!). If you have got 64K, then you will use it, *all* of it, even for the simplest of problems. And for anything complex, well, you'll just have to look around for that 128K RAM pack!

Does this matter? If larger memories *are* available, is there any point in writing efficiently? There certainly is! Apart from the obvious fact that most programmers take pride in their work (and it is difficult to be proud of something which is inefficient), consider the following situation. You have a 16K RAM Pack, and have been writing programs for months without any memory problems. One day, you decide to write a database routine, the first line of which is:

```
10 DIM A$(100, 10,15)
```

Panic! Anything you try to add produces the notorious 'error code 4', so you reduce the number of data items from 100 to 90, and then to 80. Eventually, you find you have created the world's smallest database!

Now, massive multi-dimensional arrays are *not* the sort of thing which beginners use very frequently, but look at any professionally written programs (certainly in the business field, but games and graphics programs as well), and you will see that they are extremely common. You are going to have to use them one day, and if you haven't learnt how to squeeze programs into a small amount of space by then, you are going to have problems!

## Tricks of the trade

I thought it would be a good idea to gather together *all* the possible space saving techniques I could think of into one place, for permanent reference. Here, then, in no particular order, is a complete list of memory saving 'tricks' for use with your 1K ZX81.

Some of these techniques are very obvious, and are presented without explanation; others are illustrated in the sample programs. Some are mutually exclusive (if you use one, you may not be able to use another) and some appear to 'supersede' others (they achieve the same object, but more efficiently). The actual amount of memory saved, and which of the techniques is 'best', will depend on the context in which you use them.

1. Use single-letter variable names.
2. Re-use variables as often as possible.
3. Avoid using variables altogether (eg when a result is to be PRINTed, and is not required further). For example, here is a beginner's program for calculating square roots:

```
10 INPUT X
20 LET S=SQR X
30 PRINT ''THE SQUARE
ROOT OF '';X;'' IS ''; S
```

and here is the 'improved', shortened version:

```
10 INPUT X
20 PRINT ''THE SQUARE
ROOT OF '';X;'' IS '';SQR X
```

4. Remember that loop-control variables take up more room than simple variables. Either avoid using FOR . . . TO loops or use the same loop control variable for every loop in the program.
5. Avoid using numbers! The ZX81 uses bytes to store a single digit number (or eight bytes for two digits, etc). Any of the following techniques may be more economical:

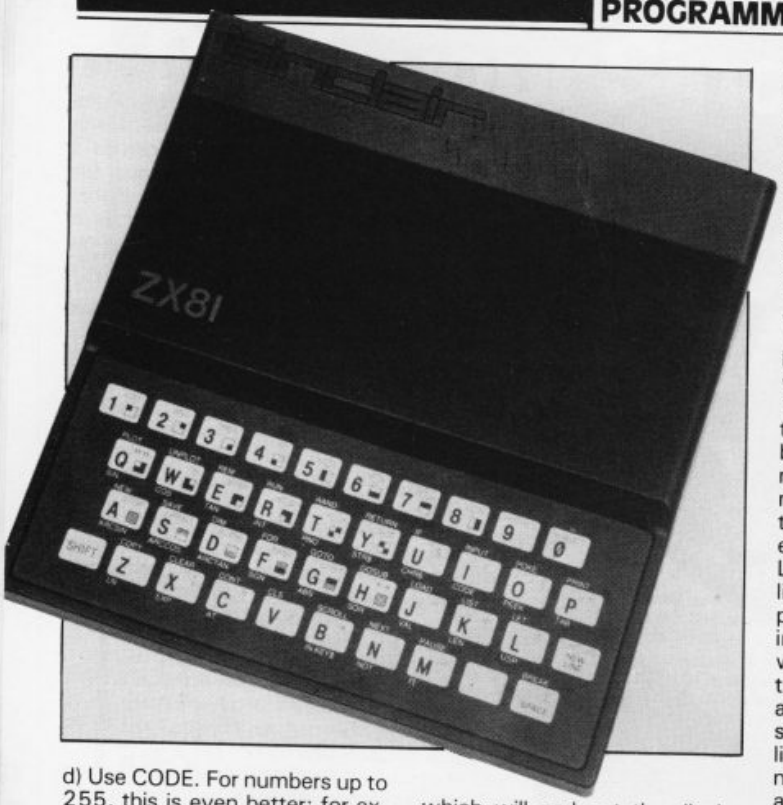
a) If a number is going to be used several times, assign a variable to that number.

b) Use previously assigned variables. For example,

```
10 LET A=1
20 LET B=A
30 LET C=A
```

will initialise all three variables although only one number is used.

c) Use VAL. The expression LET A=VAL ''200'' is more economical than LET A=200. ▶



d) Use CODE. For numbers up to 255, this is even better; for example LET A=CODE "COS".
e) Use PI. Never forget that the ZX81 already has the value of PI in its memory. OK, so there aren't many occasions when you would want the value 3.1415927 in non-trig-nometrical programs, but remember that INT PI is 3, and that some expressions (eg PRINT AT, FOR. . .TO loops, etc) treat decimal values as integers *without* requiring the word INT. Also, remember that PI/PI equals 1; PI-PI (or SIN PI, or even NOT PI, see below) equals 0, and COS PI equals −1.
f) Use Boolean logic. NOT is the easiest expression to use:

NOT (any variable with a value other than 0)=0

and:

NOT (any variable with value 0)=1

The benefits of using logical expressions cannot be over-emphasised. Re-read chapter 10 of the ZX manual, and this time, don't skip the exercises!
6. Avoid repetitive IF statements where the condition is the same for several successive lines. This is both uneconomical and poor style. Branch to a separate routine instead, or see if the lines can be compressed into one (using Boolean logic again).
7. Keep the display file to a minimum by using fewer PRINT statements, and printing everything in the top left of the screen. Avoid using commas, which will pad out the display file with spaces.
8. Although the ZX81 will not accept multiple-statement lines, you *can* combine any number of PRINT statements (including AT and TAB) into a single line, by separating them with semi-colons. (The word PRINT is only used once.)
9. Avoid using the statement STOP, by:
a) Arranging for the program to 'fall through' to a natural end at the end of the listing.
b) Making the program into a continuous loop, which can only be terminated by pressing Break.
c) Using a 'dummy variable' (unassigned) to terminate the program with report code 2.
10. Avoid using REMs (keep program notes instead!).
11. Avoid using brackets in calculations by exploiting the ZX81's expression evaluation priorities (see chapter 4 of the ZX manual).
12. Do not use low line numbers in the mistaken belief that line number 1 takes up fewer bytes than line number 1000. All line numbers occupy exactly 5 bytes. However, in the expressions GOTO and GOSUB, the numbers which follow the keyword are (to the ZX81) merely numbers, and so GOTO 1 is shorter than GOTO 1000. Therefore, arrange for all subroutines and lines which are to be frequently called by GOTO statements to have low lin numbers.
13. Use keywords in PRINT statements: "ENTER YOUR NAME" may sound better (?) than "INPUT YOUR NAME", but is less economical, because, whereas 'ENTER' must be spelt out in full, the keyword 'INPUT' may be used, and it will only occupy a single byte. (How do you set a keyword into a PRINT statement? Easy: you simply fool the computer into expecting a keyword by entering THEN (shift 3), then enter the keyword, and finally delete the word THEN.)
14. Assign variables (particularly variables which are to be used as constants, if that makes sense!) in immediate mode. This means you simply type in the required values for each variable using a normal LET statement, but do not use a line number. The ZX81 will respond with the pretty meaningless report code 0/0, but what it has done in fact is store the variable names and values, and you may refer to them in a subsequent program. The only limitations are that you must not press Run, Clear or New after assigning variables in this way (to start the program, use GOTO 0). You can, however, SAVE the program *and* the variables. (This means that even if pre-assigned variables do change their values during the course of a program, it is always possible to 're-run' by re-LOADing).
15. Finally, one last space-saving tip – use machine code. I know that this is about as useful to many users as saying "write your programs in Greek", but even if you cannot (yet!) write entire programs in machine code, why not start by using one or two small routines to replace lines of BASIC? For instance, here is a very common line which sets C equal to the CODE of the character at the top left of the screen:

```
10 LET C=PEEK (PEEK 16396
+ 256 * PEEK 16397 + 1)
```

And here is the same thing in machine code:

```
1 REM E£RND 7▛?TAN
10 LET C=USR 16514
```

In op-code form, this is:

```
2A 0C 40    LD HL,(16396)
23          INC HL
06 00       LD B,0
4E          LD C,(HL)
C9          RET
```

You can enter the REM statement directly from the keyboard provided that you remember:
a) RND and TAN are function words.
b) There is a space after the graphics character (which is the one on the T key), but not after RND.
c) POKE 16520,78 should be entered (in immediate mode) so that the '?' character will represent the correct op-code.

Just in case you are still thinking that all of this is purely academic, here is a program example which illustrates some of the above techniques and shows just how much you can fit into 1K.

## Guillotine

This program was written by Jean Hartopp. Jean is into computer graphics and 'Guillotine' makes good use of the ZX81 screen display to enhance the old 'standard' computer game where the ZX81 selects a number (in the range 1-100) which you have to guess in six attempts. The program saves on text by using the characters '<' and '>' to indicate whether your guess was too high or too low. This game will appeal to sadists who deliberately lose at Hangman just so that they can see the victim swing!

```
5 LET A=INT (RND*100)+1
10 FOR F=A/A TO 12
15 PRINT "#   #"
20 NEXT F
25 PRINT "##### 2121"
30 PRINT AT 8,7;"85"
35 PRINT TAB 6;"8HH5"
40 PRINT TAB 6;"7HG1"
45 PRINT "#-0-#  58"
50 FOR F=-5 TO 7
55 PRINT AT 10,5;"/"
60 PRINT AT F,A/A;"   "
65 PRINT "#---"
70 PRINT "#  /"
75 PRINT "# /"
80 PRINT "#/"
85 IF F>A-A THEN GOTO
   125
90 PRINT "# "
95 PRINT AT 10,5;"-"
100 INPUT G
105 IF A=G THEN GOTO 150
110 LET A$=">"
115 IF G>A THEN LET
    A$="<"
120 PRINT TAB 12;A$
125 NEXT F
130 PRINT AT 11,2;"6-"
135 FOR F=A/A TO 8
140 PRINT AT 13,F;" 0"
145 NEXT F
150 PRINT AT 11,12;A
155 INPUT A$
160 CLS
165 RUN
```

(Note that all the numbers and the letters, H and G, which appear in strings represent their respective graphic characters. The '#' symbol represents inverse space. All the other characters should be entered as listed.)

# ZX SAS

**S**erious **A**pplication **S**oftware for your
**16K ZX-81/SPECTRUM 16K or 48K**
(Please specify)

**MATHS**
For children 5-12 years of age +-*/, all with exceptional HELP facility (full step-by-step explanations) and optional entry of units, then tens. **£8.00**

**SALES LEDGER**
Ideal small business system, day-books, statements etc for up to 200 accounts. **£10.00**

**PURCHASE LEDGER**
Day-books, remittance advice etc for up to 200 accounts. **£10.00**

**INDEX/RETRIEVAL SYSTEM**
Four levels of data, usual facilities inc search on keyword or part of word. **£4.50**

**BRIDGE**
Full scoring system displays and prints full scoreboard, totals for 5 rubbers and all hands played. **£6.50**

**MORTGAGE**
How long will any mortgage be if the rate increases? What should I pay if the interest rate changes? Mortgage tells you (and more). **£5.00**

**RETAIL ACCOUNTING**
Excellent retailing system, takings/product sales analyses etc. **£10.00**

**SHARE PORTFOLIO**
Analyse and track investments listings by transaction, current holdings, P&L analysis etc. **£6.50**

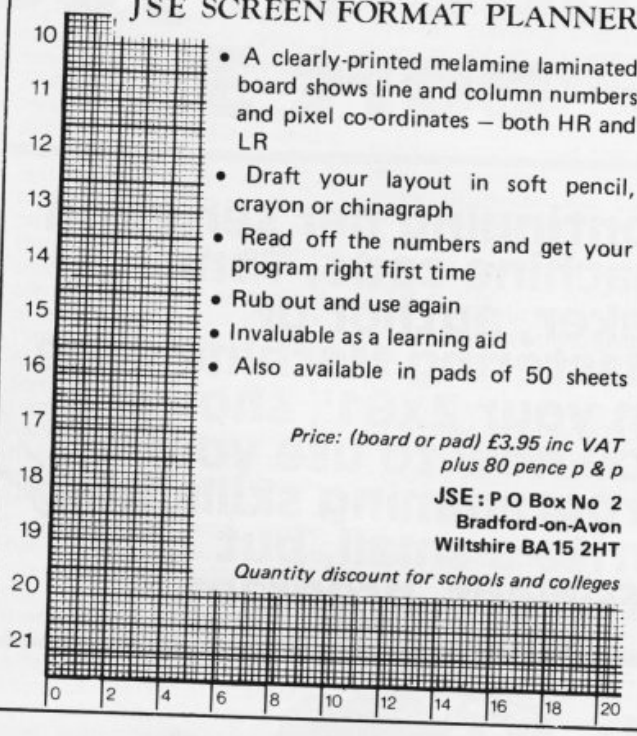
**INCOME TAX**
Tax code calculation, PAYE checking and net pay calculation for future months. **£6.50**

**ZX SAS** 42/45 New Broad St, London EC2M 1QY
(S.A.E. for more details)

## SCREEN FORMAT PLANNER FOR ZX COMPUTERS

Speed your programming by planning your screen format with the

JSE SCREEN FORMAT PLANNER



- A clearly-printed melamine laminated board shows line and column numbers and pixel co-ordinates – both HR and LR
- Draft your layout in soft pencil, crayon or chinagraph
- Read off the numbers and get your program right first time
- Rub out and use again
- Invaluable as a learning aid
- Also available in pads of 50 sheets

*Price: (board or pad) £3.95 inc VAT plus 80 pence p & p*

**JSE: P O Box No 2**
**Bradford-on-Avon**
**Wiltshire BA15 2HT**

*Quantity discount for schools and colleges*

NEW SOFTWARE

## SUPERB SPECTRUM SOFTWARE
## QUALITY THAT LEADS THE FIELD!

NEW SOFTWARE

**DERBY DAY** for the 48K Spectrum .... **ONLY £5.95 inc P&P**
Gambling on any horse in the field up to 5 players can lay bets with Honest Clive Spectrum the bookmaker as the horses circle in the parade ring. Will Clive keep that smile? Watch the race begin as the tape lifts and marvel at the amazingly realistic 3D perspective animation as the riders jockey for position. See the horses and riders in full flight as they pass Spectators (no pun intended) and into the home straight past the stands. Hold your breath at the slow motion finish. Sound and Colour is used to it's fullest in this 44K of superb programming. Not recommended for compulsive gamblers.

**THE ORB** for the 48K SPECTRUM ..... **ONLY £5.95**
Quite simply THE ORB brings the world of Dungeons and Dragons to your Spectrum. You must find the Orb and it's Base and Studs so that the Kingdom can bloom again. Choose your role, as a Wizard, Mercenary or Philosopher etc. With a miriad of monsters, excellent sound and graphics, real time battles and a complex and evil land which will only give up the orb after hours or most likely days, of enthralling play. Save facility provided for Survivors needing food or sleep.

**SOON TO BE AVAILABLE IN W. H. SMITH & MENZIES**

**RESCUE** for the 48K SPECTRUM ..... **ONLY £5.95**
How can we Summarize in a short ad, an adventure game that needs a Special Program to detail its Rules! Very, VERY simply, you must find the Map and Radio then plot your route and monitor patrols as they scour the 40+ locations you are travelling through. If you have the right equipment you can cross into Secret territory in search of the Castle and the imprisoned Princes. If you manage to find it and gain entrance there are many trails and tests. If you manage to find the Princess you must still return to base with her. Utilises all the Spectrum's facilities and takes hours to play.

**JACKPOT** for the 48K SPECTRUM ..... **ONLY £4.95**
A complete simulation of a popular fruit machine, using definable graphics to the fullest. It contains a complete introduction to the rules of it's HOLD, NUDGE, GAMBLE and FEATURE BOX with animated demo. Memory mapped reels, simultaneous revolution, staggered stop, animated bet and payout, payout board and realistic sound effect recreate the original. A must and a wallet saver for any Fruit machine buff.

ALL PRICES INCLUDE VAT & P&P. DEALER ENQUIRIES WELCOME

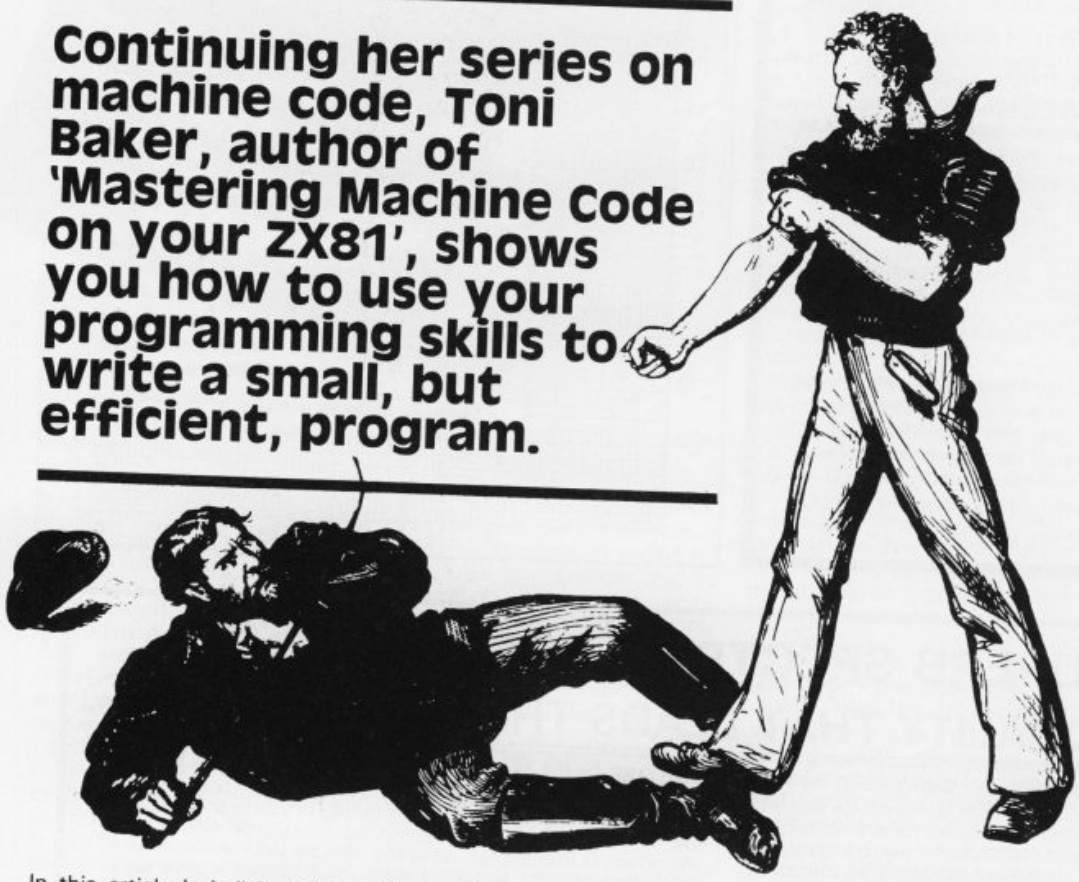
# Mastering machine code on your Spectrum — part 3

**Continuing her series on machine code, Toni Baker, author of 'Mastering Machine Code on your ZX81', shows you how to use your programming skills to write a small, but efficient, program.**



In this article I shall introduce you to a few simple machine code instructions and use them to write a short but very, very impressive program.

The first two of these instructions are CALL and RET. RET you've seen before — it is used to end a machine code program in order to RETurn to BASIC, but it also has another use. CALL and RET in machine code are quite similar to GOSUB and RETURN in BASIC. CALL is used to enter a subroutine, and RET will exit the subroutine and move control back to the instruction immediately after the CALL instruction. Instead of a line number you have an address, so CALL pq means 'GOSUB address pq' — not 'GOSUB line pq'. In machine code, remember, there are no line numbers.

And now for some more exciting machine code instructions: IN and OUT. Both of these have equivalents in Spectrum BASIC (although not in ZX81 BASIC) but most people have absolutely no idea how to use them. In BASIC, they are in a sense similar to PEEK and POKE, and so in machine code there is a certain similarity between IN and OUT, and LD r,(pq) and LD (pq),r (r means any eight-bit register, and pq means any address). Let's first look at the formats of these statements as shown below. Notice that the standard opcodes are incomplete. For instance, there is an instruction called IN D,(C); however, this is really just a shorthand notation — what it *really* means is IN D,(BC). Also note that in the above table, A is a register and n is a fixed constant. Now let's get down to what these statements actually *do*.

| Machine Code | Short For | Basic Equivalent |
|---|---|---|
| IN A,(n) | IN A,(An) | LET A = IN (256 * A + n) |
| IN r,(C) | IN r,(BC) | LET r = IN (256 * B + C) |
| OUT (n),A | OUT (An),A | OUT 256 * A + n,A |
| OUT (C),r | OUT (BC),r | OUT 256 * B + C,r |

## What's it all about?

IN fetches a number from the outside world and loads this number into a machine code register. OUT takes a number from a machine code register and sends it to the outside world. There are a number of ways in which the Z80 chip can communicate with the outside world. One way is via the keyboard. It can receive information from the keyboard using IN instructions as shown in the table on the page opposite. The number you actually get from such an IN instruction is best viewed in binary. Each such IN instruction tests five specific keys on the keyboard, and for each key produces a 1 if the key is *not* pressed and a 0 if the key *is* pressed. Bits 7, 6 and 5 will contain rubbish, bits 4, 3, 2, 1 and 0 test the keys in the order given above. For instance, suppose keys Symbol Shift and B were held down simultaneously, then IN r,(7FFE) would produce the (binary) number xxx01101. The zeroes indicate that a key is pressed. The xs are rubbish and their value is unimportant. You can achieve this test in two ways: either LD BC,7FFE/IN r,(C) or LD A,7F/IN A,(FE). See if you can deduce why both of these are equivalent to "IN r,(7FFE)".

Another way of communicating with the outside world is via the television screen — this is an *output device* (the keyboard is an *input device*). The contents of the screen itself are controlled by addresses in memory (4000 to 5AFF), but the colour of the BORDER is actually changed by an OUT instruction. Try typing (in BASIC) OUT 254,6 and see what happens. Now press Enter on its own. What's happening is that the ROM itself is re-setting the border colour (with its own OUT instruction) to whatever number is given by the system variable BORDCR. Try typing POKE 23624,6 * 8 and see what happens. Now press Enter on its own.

The instruction, OUT (xxFE),r, in any form (where the xx can be any byte whatsoever — its value is irrelevant), will instantly change the border colour to the colour whose code is contained in the register given. For example, LD A,02/LD C,FE/OUT (C),A will change the border colour to red. Notice that we do not need to worry about the B register because in this particular case its value is unimportant. This is a side-effect of the Spectrum hardware, not of machine code itself.

| | |
|---|---|
| IN r,(FEFE) scans section 0: | V, C, X, Z and Caps Shift |
| IN r,(FDFE) scans section 1: | G, F, D, S and A |
| IN r,(FBFE) scans section 2: | T, R, E, W and Q |
| IN r,(F7FE) scans section 3: | 5, 4, 3, 2 and 1 |
| IN r,(EFFE) scans section 4: | 6, 7, 8, 9 and 0 |
| IN r,(DFFE) scans section 5: | Y, U, I, O and P |
| IN r,(BFFE) scans section 6: | H, J, K, L and Enter |
| In r,(7FFE) scans section 7: | B, N, M, Symbol Shift and Space |

## All change

To change tact completely I would like to introduce you to a new set of instructions altogether — the ROTATE and SHIFT instructions. In order to understand the effect of these instructions it is useful to think of the numbers involved in binary rather than Hex (useful, although not necessary). Suppose A contains the number 00101101, and the carry flag (which I shall refer to as K) contains the number 1. The instruction RLA (which stands for Rotate Left A) will rotate every bit one position to the left. The leftmost bit of A moves into K, which itself moves into the rightmost position of A. In the example given, the result would be that A contained the number 01011011 and K would now be zero. On the other hand, if RRA were used instead of RLA (guess what RRA stands for!) then A would contain 10010110 and K would contain 1. You can do the same for any register except that the instructions are written differently — you write 'RL B' (with a space) instead of 'RLB' (without a space). In fact, there is actually an instruction called 'RL A' (with a space) which at first glance appears to do exactly the same as 'RLA' (without a space). The difference is that RL A will change the value of the Z flag, whereas RLA will not.

Flags are funny things. Their concept is quite simple — a flag is a one-bit register, or a register which can only store the numbers zero and one. There are four flags we can make use of: the carry flag, K, we've already seen; the zero flag, Z — if an instruction changes it (some don't), it will become 1 if the result of the instruction is zero, and 0 if the result of the instruction is not zero; the sign flag, S, becomes 0 for a positive answer, and 1 for a negative answer (in other words it actually equals bit 7 of the answer); and the parity/overflow flag, P, is changed in two ways: for arithmetic instructions it becomes 1 if the number increases from 7F or less to 80 or more, or if the number decreases from 80 or more to 7F or less — for non-arithmetic instructions it is set to 1 if the result contains an even number of ones, or zero if it contains an odd number of ones.

What is the point of the flag P? Its non-arithmetic use (parity check) is absolutely useless as far as I can see. Its arithmetic use (overflow check) comes into play when you're doing sums. It assumes that numbers 80 to FF are all negative (FF being minus one, FE being minus two, and so on), and so since 42 (positive) plus 42 (positive) equals 84 (negative?) — we have an overflow!

Back to the ROTATE instructions. As well as RL and RR, there is another breed of rotate instructions — RLC and RRC, which stand for Rotate Left (or Right) without Carry. If A started off as 00101101, then irrespective of the original value of the carry, RLCA would change it to 01011010 and RRCA would change it to 10010110. K *would*, in fact, be changed — its new value would be the bit which came off one end and emerged at the other, but its original value does not come into play. As before, you should note that RLCA is subtly different to RLC A, and that RLCB (etc) do not exist wheras RLC B (etc) do.

## Best of three

There are three different types of SHIFT instruction, and *all* of them are written with a space. The first is called SLA — the A stands for 'Arithmetic', so you have to put the name of a register as well, eg SLA A or SLA B. SLA is a little bit like RL except that instead of the carry moving into the rightmost bit of the register, it just disappears altogether. The rightmost bit of the register is instead always reset to zero. In effect, the value of the register has been multiplied by two. There are two similar instructions to shift right which divide the appropriate register by two. We have to remember though that numbers between 80 and FF can each have two different meanings; for instance, FE can mean either 254 or minus two. Now, 254 divided by two is 127 (in Hex 7F) whereas minus two divided by two is minus one (in Hex FF) — so there must be a simple way to overcome this problem. There are two different Shift Right instructions, called SRA and SRL. SRA (Shift Right Arithmetic) treats numbers between 80 and FF as negative and divides them by two. Its precise effect is to move each bit one position to the right, with the rightmost bit moving into the carry, and the leftmost bit remaining unchanged (bit 6 and bit 7 are always identical immediately after a SRA instruction). SRL (Shift Right Logical) treats numbers between 80 and FF as positive and divides them by two. Its precise effect is to move each bit one position to the right, with the rightmost bit moving into the carry, and the leftmost bit becoming zero.

There is one more instruction I need to give you before the program will make sense — the instruction HALT. HALT in machine code is quite similar to PAUSE 1 in BASIC. Its precise effect is to wait (for a maximum of 1/50th of a second) until the next TV frame has been output to the screen, and then to continue from the next instruction. Its use, as I have made use of it, is in synchronisation — avoiding that horrid jump you sometimes get when you change border colours halfway through the screen outputting.

The program I promised you is called Tricolours and is listed separately. You now have sufficient knowledge to be able to understand the listing. I suggest that you read the listing and see if you can work out exactly what it does, and *then* type it in to see if you were right. I think you will find it reasonably impressive, and, in fact, a rather surprising display coming as it does from a ZX Spectrum.

## Programming techniques

There are several ways to learn machine code. One way is for me to give you a program and explain why it works. Another way is for me to write a program and *not* explain how it works so that you have to work it out for yourselves — unfortunately, deciphering other people's programs (especially mine) turns out to be quite tricky. Several people have commented that they've learned far more machine code from ironing out the bugs in my programs than they have from the ones which worked, and actually wondered if the bugs were put there deliberately! (I confess they weren't — this brilliant teaching method occurs purely as a consequence of typing errors and the like!).

However, there is one last technique by which to learn machine code, and that is to write it yourself. You take a scrap of paper and scribble down a few ideas, turn the ideas into some sort of coherent pattern of how you think it ought to work (either with or without a flow diagram — it doesn't matter), elaborate it into a program or part of a program, turn it into Hex, feed it in, watch it crash, turn around three times, jump up and down, and sing the National Anthem wondering why it went wrong!

## Crash landing

Programs go wrong all the time as you're writing them, especially in machine code. The difference is that in machine code a crash is usually fairly fatal, sometimes even meaning that you have to actually switch the machine off before it will behave sensibly. (The Spectrum usually behaves quite sensibly when it's switched off.) All I'm really trying to say is that when this happens (note: *when*, not *if*) that you shouldn't be too disheartened and that you should just go back and try again, and try to find out what the error is. Usually there *is* an error — it is quite unusual for the breakdown to be caused by a glitch in the Spectrum itself, especially if you happen to find a particular glitch which only ever occurs when you try to play with machine code.

The best possible advice I can give as regards writing programs is to make all of your programs as short as you possibly can. This will train you to write programs efficiently. Making programs short involves putting all of the machine code instructions to their best possible use, and sometimes using clever little tricks to save space; for instance, using SBC HL,HL, instead of LD HL,0000 when you know that the carry is zero. One really useful instruction which really does save space is the instruction LDIR (LD, Increment and Repeat) which is equivalent to a whole set of instructions: "LD(DE),(HL)"/INC ▶

## Tricolours

Use HEXLD3 to load this into the ZX Spectrum. The BASIC part of the listing is as follows:

```
700 BORDER 1: CLS
710 FOR i=1 TO 6: PRINT PAPER 2,TAB 0: NEXT i
720 FOR i=1 TO 12: PRINT PAPER 7,TAB 0: NEXT i
730 FOR i=1 TO 4: PRINT PAPER 1,TAB 0: NEXT i
740 RANDOMIZE USR 32768
750 STOP
```

And here is the machine code part of the listing (to address 8000).

```
01FE7F      START   LD BC,7FFE
76          LOOP    HALT                    Wait for next TV frame.
3E02                LD A,yellow
219D03              LD HL,039D
CD1E80              CALL STRIPE
3E07                LD A,white
213A03              LD HL,033A
CD1E80              CALL STRIPE
3E01                LD A,blue
ED79                OUT (C),A
ED78                IN A,(C)
1F                  RRA                     Remember, it's really IN A,(BC).
38E6                JR C,LOOP               K= test on Space key.
C9                  RET                     Loop if Space key not pressed.
ED79        STRIPE  OUT (C),A               Return to BASIC.
2B          DELAY   DEC HL                  This is a subroutine.
7C                  LD A,H                  HL is the timing for a delay loop.
B5                  OR L
20FB                JR NZ,DELAY             Is HL=0?
C9                  RET                     Keep looping until HL=0.
                                            End of subroutine.
```

Use RUN 700 to RUN this program. Press the Space key to exit from it.

## Newcols

```
78          NEWCOLS LD A,B                  A = PAPER colour.
76                  HALT                    Synchronise with TV frame.
D3FE                OUT (FE),A              Change BORDER colour to
                                            new PAPER colour.
78                  LD A,B                  A=paper colour.
87                  ADD A,A
87                  ADD A,A                 Multiply A by eight.
87                  ADD A,A
81                  ADD A,C                 Add INK colour.
210058              LD HL,5800              Point HL to first attribute byte.
110158              LD DE,5801              Point DE to second attribute byte.
01FF02              LD BC,02FF              BC = number of attribute bytes,
                                            excluding the first one.
77                  LD (HL),A               Set first attribute byte.
EDB0                LDIR                    Set all remaining attribute bytes.
C9                  RET                     End of subroutine.
```

To run from BASIC, add these machine code instructions, POKE into the first statement, and CALL from the label START using USR:

```
010000      START   LD BC,????              Set PAPER and INK colours.
18E5                JR NEWCOLS              Execute machine code above.
```

For use with FN U:

```
2A0B5C      PARAMS  LD HL,(DEFADD)
110400              LD DE,0004
19                  ADD HL,DE               Point HL to PAPER colour.
4E                  LD C,(HL)               C = PAPER colour.
19                  ADD HL,DE
19                  ADD HL,DE               Point HL to INK colour.
46                  LD B,(HL)               B = INK colour.
18D8                JR NEWCOLS              Execute machine code above.
```

HL/INC DE/DEC BC/repeat until BC=0, and can be used to copy several bytes at once from one address to another. Study the program Newcols which uses this instruction — it instantly changes the foreground and background colours on the screen to those colours contained in registers B and C.

Notice that in order to use Newcols as it stands now, you have to do two POKE instructions before RUNning it in order to define what the foreground and background colours will be. Although this is not difficult, I personally consider it a nuisance, and a far, far better programming technique is as follows.

Insert the BASIC line DEF FN U(X,Y)=USR address of label PARAMS at any point in the program. Now you have complete control — you may change the PAPER and INK colours at will using statements like LET L=FN U(2,6) or LET L=FN U(7,INT (4 * RND)). The reason this works is because a DEF FN statement line is actually POKEd for us by the ROM. When a reference to FN is made, the values for it are calculated by the ROM, POKEd into the DEF FN statement, and then calculated. Once POKEd, the BASIC DEF FN statement looks like this (those bytes underlined are invisible from the BASIC listing):

DEF FN U(X OE xx xx xx xx xx, Y OE yy yy yy yy yy) = function expression.

The bytes I have written as xx xx xx xx xx and yy yy yy yy yy are the five byte Sinclair form of the two numbers in the FN U expression. If the two numbers are both integers between 00 and FF (which in this case they will be) then the Sinclair forms will actually be 00 00 xx 00 00 and 00 00 yy 00 00. The system variable DEFADD points to the first variable name inside the brackets (in this case to the x) so that LD HL,(DEFADD)/INC HL/INC HL will point HL to the first byte of the Sinclair form of the first number.

You can use this technique not just for this program, but for *any* machine code program which requires the passing of parameters from BASIC.

With that I shall leave you for now. In my next article, I'll be putting some concentration into efficient use of the stack, among other things.

# Mastering machine code on your Spectrum — part 2 continued . . .

In the last issue of ZX Computing, we were unable to reproduce two of the tables Toni promised you in the article. The space we had allocated for the tables proved insufficient so, rather than squeeze them in in incredibly small type, we decided to publish half last month and the rest below. We apologise for any inconvenience this may have caused, but we hope you'll agree it was worth waiting for!

## Win some software for your Spectrum in this easy-to-enter competition

Here's a chance for you to win some software for your ZX Spectrum.

And it's easy! All you have to do is to make as many words of four letters and over out of the Spectrum keyword 'RANDOMIZE'. All the words must be in the English language and will be checked against those listed in The Concise Oxford Dictionary of Current English, sixth edition.

Fill in the words you have found in the space provided on the coupon, along with your name and address, and post off your entry to us. But before you do, make sure you write the number of words you found, on the back of the envelope. The coupon provided has room for 40 words — should you find more words than you can fit on the coupon, you may attach a separate sheet (but you must still enclose the original coupon or a photocopy).

There will be three winners to this competition — either the three entries with the highest number of words or in the case of more than three entries sharing the highest number of words, these entries will be placed in a hat and the winners will be the first three chosen at random.

### The prizes

The three winners will each receive one of the following three cassettes by Artic Computing.

**Spectrum Chess (48K)** There are six levels of difficulty in this version of chess. Including the facility to 'castle' and 'en passent', the program also allows you to alter the level of play or even swap colours during a game!

**Spectrum Bug (16K/48K)** This program is a machine code monitor and debugger. Occupying 1½K of memory, the program provides you with 16 new commands for your Spectrum.

**Planet of Death (16K/48K)** In this adventure game, you find yourself stranded on an alien planet separated from your spaceship. Your mission is to overcome the hazards and dangers of the planet, and find your spaceship. This cassette is also one of the new range of software released by Sinclair Research.

### Rules

This competition is open to all UK and Northern Ireland readers of ZX Computing except employees of Argus Specialist Publications Ltd, their printers and distributors, employees of Sinclair Research Ltd and their distributors, employees of Artic Computing and their distributors, or anyone else associated with the competition.

As long as the correct coupon is used for each entry, there is no limit to the number of entries.

All entries must have the number of words found written on the outer flap of the envelope. Entries without this number will not be accepted.

All entries must be postmarked before the 31st March, 1983.

The prizes will be awarded to the three entries with the highest number of correct words found, or in the case of a tie, three of the highest entries will be chosen at random.

All words found must be within The Concise Oxford Dictionary of Current English, sixth edition.

No correspondence will be entered into with regard to the results and it is a condition of entry that the Deputy Editor's decision is accepted as final.

The winners will be notified by post and the results will be published in a future issue of ZX Computing.

## "A" LEVEL AND UNIVERSITY STUDENTS RESEARCHERS, SCIENTISTS

# University Software

## PRESENTS SINCLAIR ZX81 (16K)* LIBRARY OF ADVANCED MATH/STAT/ECON

Made easy to learn and use with full instructions.

**TAPE 1 : MATRIX OPERATIONS** **£5.95**
Side A : Inversion, multiplication, addition, subtraction and scalar multiplication of matrices and vectors within one single program which allows the user to complete all his operations without reloading. Inverts a 20 x 20 matrix in 6 min. 40 secs.
Side B : Determinants of square matrices.

**TAPE 2 : POLYNOMIALS** **£5.95**
Side A : Includes quadratic equations (as degree 2 polynomials) and Newton-Raphson and half-interval search methods for higher degree polynomials. Computes the roots with 8 digits of precision.
Side B : You can plot polynomials in any interval and examine their roots, extremum points.

**TAPE 3 : INTEGRATION** **£5.95**
Side A : Integration of functions by Simpson's and trapezoidal rules. Also computes the area enclosed by two functions.
Side B : Plot of integrals. Integration can be visualised on the screen.

**TAPE 4 : REGRESSION** **£6.95**
Side A : A highly developed multivariate regression program featuring up to 20 independent variables, log/ln option on each variable (thus allowing exponential, geometric and nth order regressions), standard errors, t-statistics, F-statistic, Durbin-Watson statistic, interpolation.
Side B : Plot of bivariate regressions. You can see how your computer draws a best-fitting line on a set of data points.

**TAPE 5 : LINEAR PROGRAMMING** **£6.95**
Side A : A general and efficient optimization program capable of handling any sort of linear programming problem with up to 20 variables and 20 constraints. Features the cannonical equivalent of the original problem and its dual.
Side B : Solutions of simultaneous equations with up to 30 unknowns.

- Cheques, P.O.'s payable to :

UNIVERSITY SOFTWARE

THE VERY BEST IN MACHINE CODE FOR THE **ZXSPECTRUM** & **ZX81**

SPECTRUM 16K **GULPMAN**... game of the '.....man' variety with 15 mazes, 4 chasers, laser defence, 9 grades, 9 speeds, demo mode, choice of joystick control. "An extraordinarily good program" raves Boris Allan for Popular Computing Weekly. We think you will agree. £5.95

SPECTRUM 48K **MASTERFILE**... business/domestic filing and reporting system. So flexible that it is equally usable for your mailing lists, catalogues, stock control, text extracts ..... applications are endless. Fully user-defined data and report display formats, dynamic variable-length file, records and data items. Fully menu-driven with powerful search facilities, sorting, total/average, update, multiple independent files, printing. Yes, we aim to support microdrive when Uncle delivers. Nearly all the 8K we use is machine code, so you get 32K per file. Comes with example file and 22-page manual. £15.00

SPECTRUM 16K **SPDE**....Disassembler and Editor, as used by other ZX professionals, and we used it to develop the above. £5.95

ZX81 16-48K **THE FAST ONE**....is the predecessor to MASTERFILE and is in use all over the world now. Specification is very similar to MASTERFILE. £12.00

ZX81 16K **GULP 2**..almost identical spec to GULPMAN. £4.75

*All programs supplied double-recorded and mailed 1st class by return. Prices include VAT and postage within Europe. SAE for full list.*

## Have a day at the races with Terry Mills of Stockport.

In this program for the unexpanded ZX81, there are four horses (denoted by inverse numbers) running in a race.

Here is a breakdown of the listing to show you how the program works:

| | |
|---|---|
| Line 5 | Displays the start and finishing posts of the course. |
| Lines 10-50 | Set up the variables. |
| Line 55 | Prints a space over the old position of the horses. |
| Lines 60-80 | Calculate the random movement of the horses. |
| Line 81-82 | Introduce a slight delay before the next movement of the horses is made. |
| Lines 85-90 | Print the horses in their new position in the race. |
| Line 95 | Decides if a horse has won the race; if a particular horse has won, the winner is displayed and the game ends. |
| Line 100 | If none of the horses have reached the finishing post, the program returns to print the new position of the horses. |

Should you wish to speed up the race, lines 81 and 82 may be omitted. Should you have more than 1K available, you may wish to include a short routine to allow players to have small bets on the different horses.

```
5   PRINT AT 0,0;"-START
    -";AT 20,0;"-FINISH-"
10  LET A=1
15  LET B=0
20  LET C=1
25  LET D=2
30  LET E=1

**With so many publications being written for the Spectrum, which one should you look at first? Our review panel take a brief look at ten of the new titles to help you make your choice.**

## Spectrum Machine Language For The Absolute Beginner — Edited by William Tang

This book is designed as an introductory text to the field of machine and assembly language programming for the ZX Spectrum.

Inside the book, there are five section headings, each of which has been split up into a number of sub-sections. The first section is called 'Finding your way around in machine language' and starts from the very beginning, assuming absolutely no prior knowledge of working with machine language. From the basics, though, you quickly move onto how to manipulate the stack, loops and jumps, use of subroutines and block operations.

The second section of the text deals with 'Instructions that are less frequently used' and covers register exchanges, rotates and shifts, interrupts and restarts, and many others. As in the first section of the book, the text is liberally sprinkled with examples for you to try and most of the sections end with either a summary of the information in that section or a number of exercises for readers to work their way through.

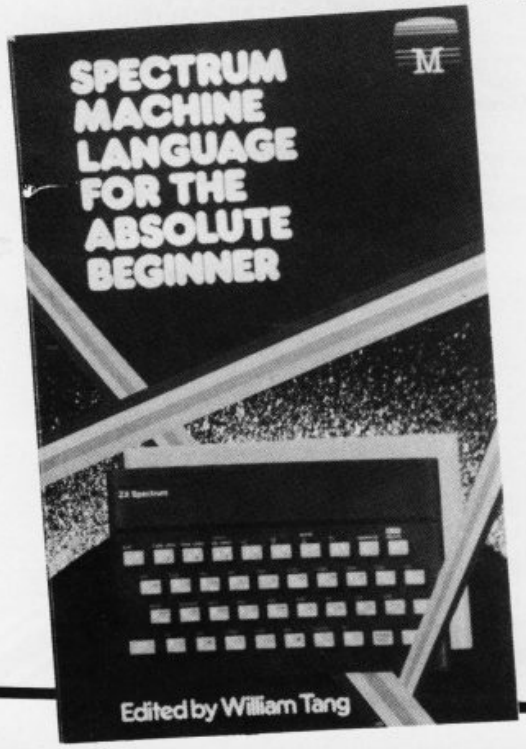
The next section, 'Programming your Spectrum', deals first with the planning of a program; this is fairly comprehensive, dealing mainly with the 'top-down' approach to disciplining your programming. Then the authors take a look at the Spectrum itself, paying particular attention to the keyboard, the video screen display and the sound output.

The last two sections concentrate on actual programs listed within the text. Looking first at monitor programs, there are two provided: EZ-Code Machine Language Editor and HexLoad Machine Code Monitor. As well as clearly reproduced listings, the programs are accompanied by an explanation of each.

The last section concentrates on the production of one program, Freeway Frog, which is listed over 36 pages of the book. From first programming principles, the structure of the program is planned, developed and finally put together to form a complete listing.

There are seven appendices, with useful data you'll need when you begin experimenting with machine and assembly language yourself.

*Spectrum Machine Language For The Absolute Beginner, edited by William Tang, is published by Melbourne House. The book has 243 pages and is priced at £6.95.*
*ISBN 0 86161 110 1*



## Games ZX Computers Play — Edited by Tim Hartnell

Recently crowned the 'Barbara Cartland of the computer book field', Tim Hartnell here produces a book for the Spectrum and ZX81 which would fall into the 'fun' section of his range of books.

Containing 15 programs for the ZX Spectrum and 15 for the ZX81, all the listings are direct from the ZX Printer, well reproduced and guaranteed to run. The emphasis is on moving graphics, intelligent play by the computer, user-defined graphics where needed, and providing the reader with programming ideas which can either be adapted, converted or improved on.

The book contains a variety of programs contributed by a number of experienced programmers. There is a Spectrum version of a three-dimensional maze, and many arcade-type games such as Breakout, Zombies and Quack Attack. There are also the wide range of card games and board games.

Each program is accompanied with a brief explanation of how the program works. In some cases, the programs are illustrated with screen display dumps of the game being played.

*Games ZX Computers Play, edited by Tim Hartnell, is published by Interface Publications. The book has 169 pages and is priced at £3.25.*
*ISBN 0 907563 13 9*

## The Spectrum Pocket Book — Trevor Toms

Continuing the 'Pocket Book' series, this book goes further than its two predecessors about the ZX80 and ZX81, providing the reader with programs which are fun, serious, educational, and a number of 'useful' tools for your Spectrum.

The programs in the first part of the book, the BASIC section, cover a variety of subjects. Ranging from the obvious games programs such as Robot Chase, 3D Maze and Reversi, there are also a number of 'serious' listings such as Budget Account, Debugging Programs, Useful Subroutines and User Graphics Tablet.

The second part of the book, the Machine Code section, begins with an introduction to machine code followed by a comprehensive section relating the use of machine code directly to your ZX Spectrum. Also included in this section are ZXASM, a Symbolic Assembler; ZXDISASM, a Symbolic Disassembler; and ZXMCMON, a machine code monitor. An ap-

pendix at the back of the book contains a screen toolkit.

All the program listings have been produced using an RS232C interface which was specially designed (and available in design form from the author). The listings are fully annotated to help you understand the structure and thinking behind the program, and all the Spectrum keywords are printed in a bold typeface.

An explanation of each program is provided and the listings are clearly reproduced. All the programs are for the 16K ZX Spectrum.

*The Spectrum Pocket Book, written by Trevor Toms, is published by Phipps Associates. The book has 160 pages and is priced at £6.50.*
*ISBN 0 950 7302 8 9.*

handled. The second chapter continues the theme of tying the Spectrum in with business, with three programs which are fairly self-explanatory: Budget, Accountant and Banker.

Chapter three concerns itself with Spectrum graphics with five programs which amongst other things help you create new characters, draw pictures and define a design of up to 65536 by 65536 pixels across. The fourth chapter sets the Spectrum up as a home tutor complete with three programs providing a multiple choice test with up to 1,000 different questions and answers, a multiple picture reading tutor, and a listing which tests your knowledge of geography.

The author has provided a collection of miscellaneous

*The Working Spectrum, written by David Lawrence, is published by Sunshine Books Ltd. The book has 216 pages and is priced at £5.95.*
*ISBN 0 946408 00 9*

## Learning To Use The ZX Spectrum Computer — Robin Bradbeer

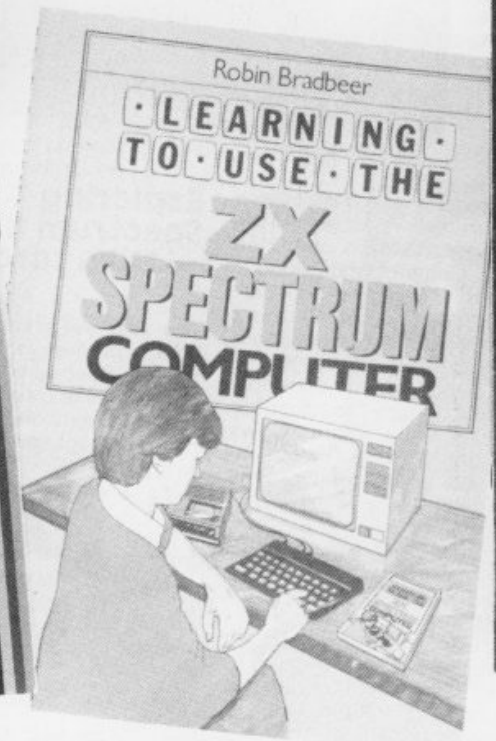
This text is part of a general series of 'Learning To Use...' books which puts the emphasis on the beginner using the computer in work or leisure, rather than becoming a computer theorist.

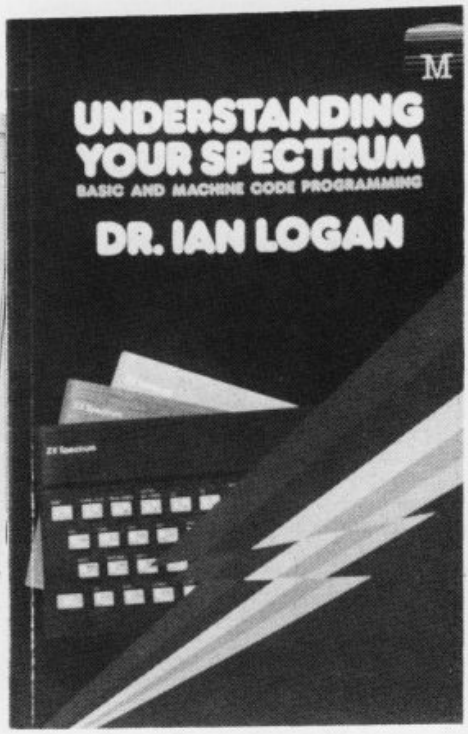
Beginning the book is a

readers gauge their success.

The fourth chapter tackles the subject of graphics, concentrating on the screen and memory, patterns and the use of colour, movement and animation, user definable graphics and sound. Examples are included allowing the reader to illustrate the techniques with some practical programming.

Chapter five includes some of the special features of the ZX Spectrum with particular reference to the internal clock, special locations and how to examine them, and the user port. Three appendices are provided covering further reading, the differences between ZX81 and ZX Spectrum BASIC, and a glossary.





## The Working Spectrum — David Lawrence

This book is based on a collection of programs written on such areas as data storage, finance, calculation, graphics, household management and education.

Split into six chapters, the first chapter highlights the Spectrum as a filing cabinet. Providing a program called Unifile, any file containing records with a regular structure can be

routines in chapter five, including Calculator, Calories, Graph, Renumber and Typist. Traditionally, all computer books should contain at least one game, and this book is no exception. Three games listings are included — Tracker, Missile and Word Sort.

Each listing is given as a series of modules. The modules are accompanied by an explanation of its function, a commentary on the individual lines, and suggestions are given to perform simple tests on the module to assure yourself that the module is correct before continuing to type any more in.

chapter introducing the Spectrum, followed by a section on using the ZX Spectrum. This last chapter tells you in very simple and easy-to-follow instructions, how to begin your computing career on the machine. At the end of the chapter some self-test questions are included for the reader to assimilate how much experience has been gained.

Chapter three introduces the reader to some elementary programming skills, with details on how to SAVE programs on cassette and how to use the ZX Printer. Again, self-test questions are provided to help

*Learning To Use The ZX Spectrum Computer, written by Robin Bradbeer, is published by Gower Publishing Company Ltd. The book has 76 pages and is priced at £4.95.*
*ISBN 0 566 03481 6*

## Understanding Your Spectrum — Dr. Ian Logan

Dr. Logan claims this book has three main aims: to explain, in simple terms, how the Spectrum works; to teach Z80 code ▶

from first principles; and to give details of monitor entry points so that efficient programs may be written.

And the author does his best to explain all of it — no easy task! The first two chapters introduce commands and functions which Sinclair BASIC has to offer. Programming examples are provided throughout to aid readers in their understanding.

The third chapter moves into the realms of machine code providing an introduction to the Z80 microprocessor. Illustrations are used where possible to help with this explanation. This is followed by a section on the mathematics of machine code programming and one on the Z80 machine code instruction set.

It is at this stage that you are provided with some sample programs to use and understand. Twenty-two programs are provided in total. The final two chapters of the book concentrate on an outline of the 16K monitor program resident inside the Spectrum and how to utilise the monitor program's subroutines.

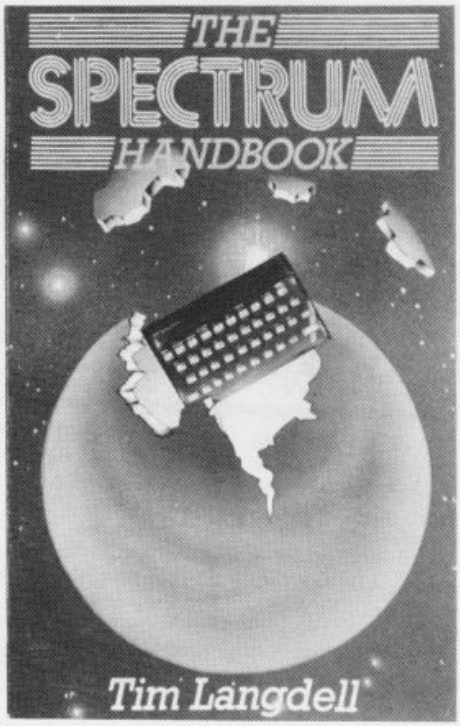
Four appendices are included at the back of the book complete with useful reference tables for Z80 machine code instructions, and decimal to hexadecimal conversion. There is also a list of the currently available machine code handling programs. The last appendix is a list of 11 programming errors in the 16K monitor program in the Spectrum, at least two of which are very useful to know.

*Understanding Your Spectrum, written by Dr. Ian Logan, is published by Melbourne House. The book has 190 pages and is priced at £7.95.*
*ISBN 0 86759 114 5*

## The Spectrum Handbook — Tim Langdell

The first section of this book is called 'Getting started on your ZX Spectrum' and that is what you are encouraged to do very soon into the text.

The first section is split into five chapters, first introducing you to the various ins and outs of the ZX Spectrum, and then guiding you through colour and sound, and the other intricacies of BASIC programming. The chapter on graphics in motion provides a simple introduction to the subject which is covered in much more detail in the following section entitled 'Colour, Graphics and Sound'.



The third section of the book is entitled 'Gamesmanship', and introduces the reader to a number of the 'tricks of the trade' with some example games programs to illustrate the points made. There follows a very short chapter on educational and serious applications which includes a small word-processor program, a filing system and a statistics listing.

The final section of the book is called 'Taking your Spectrum to the limits' and it attempts to guide the reader to improving your programming. There is also a chapter on machine code programming and two appendices with the ASCII table and the Spectrum's memory map.

The book is well-illustrated with programs and screen displays, and contains a wealth of hints and tips for the beginner and experienced alike.

*The Spectrum Handbook, written by Tim Langdell, is published by Century Publishing Company Ltd. The book has 216 pages and is priced at £4.95.*
*ISBN 0 7126 0152 X*

## Exploring Spectrum BASIC — Mike Lord

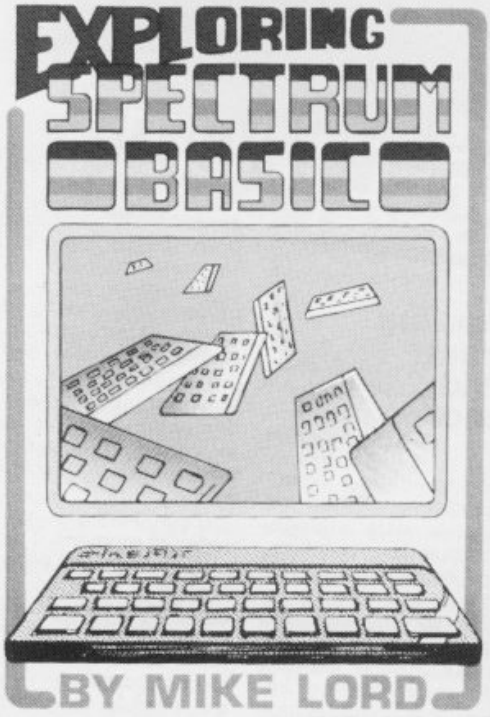
The first six chapters of this book introduce the reader to the ZX Spectrum, the various commands and functions available on the machine, and some of the programming features which can be used such as looping, arrays and data handling. There is also a chapter describing the creation of a program — Calendar — and the subsequent debugging of the listing.

Then, once you have presumably got the hang of manipulating simple programs, you are provided with over 50 full programs together with detailed explanations. As new techniques are used within the programs provided, some explanatory text is given to show the reader what is going on. Numerous short routines are also included within the text for illustrative purposes.

The listings are all clear and easy to read, and the Spectrum keywords are printed in a bold typeface. Screen display dumps are used throughout the book to illustrate the text.

The last two chapters of the book are called 'Applications', containing such programs as Linear Programming, Simultaneous Equations, Pearson's Correlation, and a General Purpose Graph Plotter; and 'Utility programs, quirks, and useful routines', which contains programs to test the ROM and RAM, Renumber routines, etc.

Three appendices are included entitled 'Places to PEEK & POKE'; 'Speeds', which you can use to speed up the rate at which the program runs; and 'Other BASICs', which explains some of the difference between Sinclair BASIC and the rest.



*Exploring Spectrum BASIC, written by Mike Lord, is published by Timedata Ltd. The book has 191 pages and is priced at £4.95.*
*ISBN 0 907892 03 5*

## Games To Play On Your ZX Spectrum — Martin Wren-Hilton

This book provides the reader with 13 programs for the ZX Spectrum.

Each program comes complete with an explanation of the structure of the listing and a screen photograph of the game once it has been correctly typed in and RUN. The listings are all very easy to read and in some cases, illustrated with quite witty cartoons.

The programs included in this publication are Breakout, String art, Helicopter, Worm race, Flower, Mastermind, Monitor, Bomber, Kaleidoscope, Customer, Spiral, Stunt bike and Draughts.

All the programs will RUN on the standard 16K Spectrum.

*Games To Play On Your ZX Spectrum, written by Martin Wren-Hilton, is published by Shiva Publishing Ltd. The book has 43 pages and is priced at £1.95.*
*ISBN 0 906812 28 3*

## The Spectrum Programmer — SM Gee

The first two chapters of this book gently introduce you to the idea of learning to use your Spectrum, with some good advice for getting the best out of your machine.

Once set up, consult chapter three which takes you through the first steps of programming, with a look at variables, and the keywords PRINT, LET and INPUT. The following chapters concentrate on looping, handling text and numbers, and using functions and subroutines. Chapter seven introduces you to the use of graphics and completes your introductory study of programming techniques.

It is at the end of chapter seven and the following chapter that the reader is introduced to the idea of using these newly acquired skills to write a simple games program. Chapter eight deals with the use of sound on the Spectrum and ends with a simple program of the alien invader type which illustrates what you should have learnt so far.

Chapter nine deals with high-resolution graphics on the Spectrum showing use of the graphics commands, with sections on high-resolution colours and un-plotting. The final chapter of the book is called 'Logic and other topics', completes the Spectrum tutorial.

*The Spectrum Programmer, written by SM Gee, is published by Granada Publishing. The book has 141 pages and is priced at £5.95.*
*ISBN 0 246 12025 8*

## Publishers

The books mentioned in this article are published by the following:

Melbourne House (Publishers) Ltd, Glebe Cottage, Glebe House, Station Road, Cheddington, Leighton Buzzard, Bedfordshire LU7 7NA.
Interface, 44-46 Earls Court Road, London W8 6EJ.
Phipps Associates, 99 East Street, Epsom, Surrey KT17 1EA.
Sunshine Books, Hobhouse Court, 19 Whitcomb Street, London WC2 7HF.
Gower Publishing Company Ltd, Gower House, Croft Road, Aldershot, Hampshire GU11 3HR.

## ZX81 16K SPECTRUM RAM Cassettes

### Games to Test your Skills & Tactics

"VERY NASTY MOUNTAIN and NASTY INVADERS...are both very well written"; "I am thoroughly pleased with the goods" : Client, London
"Thanks for your very good VERY NASTY MOUNTAIN": M.F. Harold, Guildford, Sy.
"NASTY INVADERS...VERY NASTY MOUNTAIN : with no loading problems at all and the literature you included, will certainly purchase from you again": N.D.H., Huddersfield
"I am writing to congratulate you on the excellent VERY NASTY MOUNTAIN. I am also pleased with the quick delivery": R.Massingham, Batley, W. Yorks.
"I like NASTY INVADERS...the graphics are excellent; VERY NASTY MOUNTAIN is also an excellent game. These are two of the best games I have for my ZX81.": Michael B. McAllister, Lakenheath, Suffolk

NASTY INVADERS: Get them before your Bosses get you! £4.95
A 20 minute plus Action-Packed Game. You are on duty in the Defence Radar Centre. An invasion starts. Your task is to prevent the Enemy from landing. But you have problems: not only do you have to stop the Invaders making repairs to their craft, but there could be personnel trouble too! Good control is rewarded, but errors are penalised.
Don't despair — Rank Has Its Privileges!!

NASTY MOUNTAIN: Solve the Clues if you want to Escape! £4.95
You are leading an expedition and come to an impassable mountain range. It looks like a long detour until an old goat-herd announces that there is an opening in the rocks into which the occasional animal wanders, but they never re-appear..... See if you can solve the mysteries of Nasty Mountain and continue on your travels. Whether you succeed or fail, you can always try again — but somehow its not quite the same as before!

VERY NASTY MOUNTAIN: But don't CHEAT or you will pay for it! £6.95
An advanced version of the Nasty Mountain Game with 16 Levels of Play. Practice Makes Perfect — but the more clues you solve, the more your tactics are tested!

### Justify Your ZX 81 As A Business Expense

PETTY CASH/VAT: Know where your Money went! £10.00
Enter Date, Narrative and Gross Expenditure for each Cash Purchase. Analyses into 20 Sub-Headings and 13 Main-Headings and gives Gross, VAT, Net and Exempt Subtotals and Totals. Its so good, we use it ourselves.

VAT BOOK INPUTS: Written for the Small Business & Sole Trader £12.00
As the Petty Cash/VAT Program, but with the facility to add in your Cheque and Standing Order Items to give Inputs Bottom Line Totals.

**CHEQUES/P.O.s TO:— GILTROLE LTD., DEPT. ZXC, P.O. BOX 50, RUGBY, WARKS. CV21 4DH**

## ZX SPECTRUM & ZX81 EDUCATIONAL SOFTWARE

**Spectrum Junior Education** £5.50
Use your Spectrum to help your children with their school work. This cassette contains eight attractive, easy-to-use programs for the 7 to 11 age group.

Topics include English comprehension, spellings, homophones, junior science, maths and history.
* Entering your own questions and answers allows you to adapt two of these programs for exercises in any subject area.
* Moving colour graphics and sound are extensively used to improve motivation.
* Use the "draw" program to produce pictures, maps and diagrams.

Suitable for the 16K or 48K Spectrum. Program notes are supplied.

**O-Level Chemistry (C1)** £5.50
This cassette contains four clearly presented revision/tutorial programs. The subject matter has been carefully structured to cover the most important aspects of:

* Elements, compounds and mixtures.
* Structure, bonding and properties.
* Redox, electrolysis and the activity series.
* Acids, bases and salts.

48K Spectrum and 16K ZX81 versions of the cassette are available. Please specify which you require.

*Professional Computer Assisted Learning materials from:*

**CALPAC COMPUTER SOFTWARE**
**108 Hermitage Woods Crescent, St Johns, Woking, Surrey GU21 1UF.**

Overseas orders: £6.50 ($11.60) per cassette; includes AIRMAIL postage.

# Great games for your Spectrum

from MIKRO-GEN the leaders in ZX games

## Sorcerer's Castle

Takes you into a world of magic and mystery. Graphical position and a host of options with this exciting adventure game for the 48K Spectrum **£5.50**

NEW

## Scramble

High-speed arcade game – the fastest available. Thrust, altitude, fire and bomb controls. For 16K or 48K Spectrum. **£5.50**

## Masterchess

Ten levels of play + change sides or level in mid-game + set board to any position + scrolling history + displays your moves and computer's + copy display & history to printer any time + save game at any point + recommend move option + plays all legal moves + indicates illegal moves + Chess Clock on reverse. A powerful, adventurous and enjoyable 48K program **£6.95**

the program for the real player!

## And for your ZX81:

**Scramble ★ Frogs ★ PaintMaze ★ ZX Chess ★ Breakout ★ Space Invaders ★ Asteroids ★ Tempest ★ 1K Games-pack ★ Debug**

**All supplied on cassette with library case £3.95 (ZX Chess £6.50)**

Write for full details of the Mikro-Gen range of programs and add-ons, available from local stockists or direct from the manufacturers (please make cheques/PO's payable to Mikro-Gen and add 40p post & packing)

Suppliers of Software to Sinclair

**MIKRO-GEN**

# Home run

## Get home as quickly as you can with this program for the 1K ZX81 from Andrew Tierney of Reading.

The object of this game is to move the black square to the chequered square in the shortest possible time.

You move the black square using the '5' key for left, the '6' key for down, the '7' key for up and the '8' key for right. There is a time limit for you to reach your home square; this time limit decreases, thus making your task harder, each time you successfully get home. Your score for each turn is the number of time units you have left when you reach the chequered square.

```
10  LET C = 50
20  LET A = 0
30  LET B = 0
40  LET X = INT (RND * 10)
50  LET Y = INT (RND * 10)
60  PRINT AT X,Y;
    "(Graphic shifted A)"
70  FOR N = 1 TO C
80  PRINT AT A,B;" ■ "
90  PRINT AT A,B;"   "
100 IF INKEY$ = "5" THEN
    LET B = B-1
110 IF INKEY$ = "6" THEN
    LET A = A - 1
120 IF INKEYS$ = "7"
    THEN LET A = A + 1
130 IF INKEYS$ = "8"
    THEN LET B = B + 1
140 IF A = X AND B = Y
    THEN GOTO 180
150 NEXT N
160 PRINT "HARD LUCK"
170 STOP
180 PRINT "WELL DONE -
    SCORE = " C - N
190 PAUSE 50
200 LET C = C-1
210 CLS
220 GOTO 10
```

Note that the contents of the bracket in line 60 should be replaced by the graphics symbol described.

# Conquering LOAD/SAVE problems

## Tim Hartnell and Ian Beardsmore summarise advice from members of the National ZX Users' Club.

One of the real bugbears of the ZX81 is the touchiness of the cassette interface. While few ZX81 owners have problems getting some sound onto a cassette from their computers, getting this sound back into the ZX81 as a program is often a major hurdle to full enjoyment of the computer.

Some of the following advice will not be relevant to your particular computer/cassette setup, so read through all the advice we give until you find something that appears to apply to you, and they try out the suggestions given.

### In a jam?

Make sure the outputs from your cassette player are compatible, that is you have 3.5mm sockets, and check that the plugs fit firmly. Some appear to work better if they are moved a fraction of an inch out of the computer, rather than being jammed hard into the ZX81. The ZX80 and the ZX81 need four to six volts peak output. If you have a DIN socket, it is almost certain not to work. Most DIN outputs are about 1.5V. This is not enough for the ZX81, and will only work if a special buffer circuit is put between the recorder and the computer.

If you have a 16K program, trying SAVEing, then LOADing a very short program without the pack on, and then with it in place. If they both LOAD/SAVE, then try a longer program. If the longer program does not LOAD/SAVE, then the problem could well be overheating, something that can cause problems within 15 minutes of turning the computer on.

If you get LOAD/SAVE problems only with the 16K RAM Pack attached, then try the following ideas. They sometimes bring results, even with mischievous RAM packs.

1. Keep your ZX cool. This can be done by using a fan, or by placing something cold on top. Tim's first book, **Making the most of your ZX80**, was written with the aid of a succession of frozen Long Life milk cartons. If you follow this somewhat bizarre idea, make sure that the water doesn't get into the computer. If you have an extreme heating problem, and you feel confident of your ability to do it, you can take the top off, and/or solder in an extra heat sink.
2. Don't jar the computer while SAVEing or LOADing.
3. Try different volume levels when LOADing, and keep the tone control on maximum (ie full treble). You'll need a lot of volume in most cases, and maximum treble.
4. Noise can be a source of LOADing problems. There should be about five seconds of silence before a program. Tape hiss is not conducive to a successful load.
5. Use good, proper computer cassettes, rather than cheap low-noise audio ones. Quality audio cassettes (such as TDK) generally work well.
6. Clean the tape head frequently, and — if you can get one — use a demagnetiser from time to time.
7. If your cassette recorder has batteries, try it with them, rather than running the recorder from the mains. You should find this helps.
8. Make several copies of each program, so if one doesn't load, you can always try the next one on the tape. Frequent use of a tape (or one portion of it) will lead to a buildup of hiss over the program, which may eventually make it impossible to load from.

### Hardware aids

The following suggestions are for you if you can solder confidently. These suggestions are more for ways of checking that the signal is getting from the recorder to the computer, than specific aids in LOAD/SAVE.

1. Wire an LED into the leads.
2. Use crocodile clips to tap directly off the loudspeaker.
3. Connect a wire across the spring-loaded loudspeaker/earphone switch (in the recorder across the earpiece jack), so you can hear what is going on.
4. Wire a small earpiece into the leads.
5. Wire the loading lead directly from the output signal. Fit a switch which can be used to disconnect the internal speaker while loading.

### Which recorder?

The Users' Club has often been asked 'Which cassette recorder works best?'. We cannot endorse a particular brand of recorder, and do not suggest that while club members have been successful with the following brands, you will necessarily have the same success, but for what it's worth, here are some of the recorders which club members have used successfully: ITT Studio recorder 66; Boots CTR500; Tandy Micro minisette II; Sony TCP55; Interstate/Waltham (Woolworths); Hitachi TRQ291 and TRQ247; Prinzsound TR2256; Ferguson 327; Sanyo M2406P; Prinz SC9; and the machine which is widely advertised for use with the ZX81, the Monolith ECR81, data-assette E312.

### Adjusting azimuth

Mr S Atkinson of Harrogate suggests the following. He points out that, for loading, the output from the cassette needs to contain as much treble as possible. You can increase the treble content of the recorder's output by changing the tape head azimuth, the alignment between the tape head and the tape.

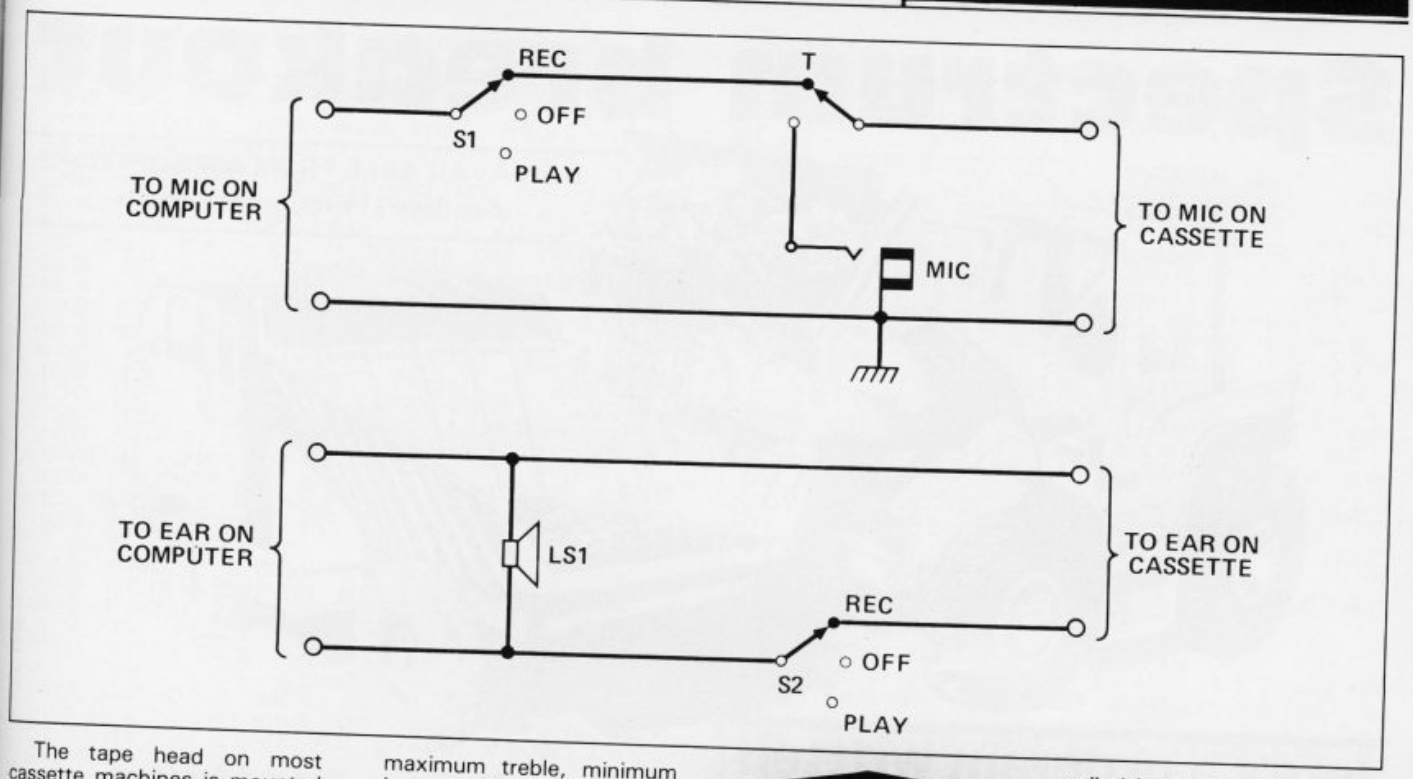

*Fig. 1. S1 and S2 are both 2-pole, 3-way slide switches and S3 is a 1-pole, 2-way biased push button slide switch. J is a 3.5mm jack socket for a microphone and LS is a miniature 75Ohm loudspeaker. You will also need four 3.5mm jack plugs with screened leads. This circuit can be contained in a box measuring 3" by 2½" by 1½".*

*The switching allows recording and playback without removing plugs. The push button allows audio inject for identification. The speaker is used for audio monitoring.*

The tape head on most cassette machines is mounted on two screws, one of which is sprung. By adjusting this screw, the tone can be altered. The screw is accessed by a small hole above the play head. In many cases, this hole is covered by tape, or a small metal plate.

Here's how you can adjust your azimuth:

1. Turn the recorder controls to maximum treble, minimum bass, and insert a tape containing a program.
2. With the earpiece out, start the recorder.
3. Adjust the screw, trying it in both directions, until the sound is as 'tinny' as possible.

Note that this may make some of your music cassettes sound a little too sharp for your liking.

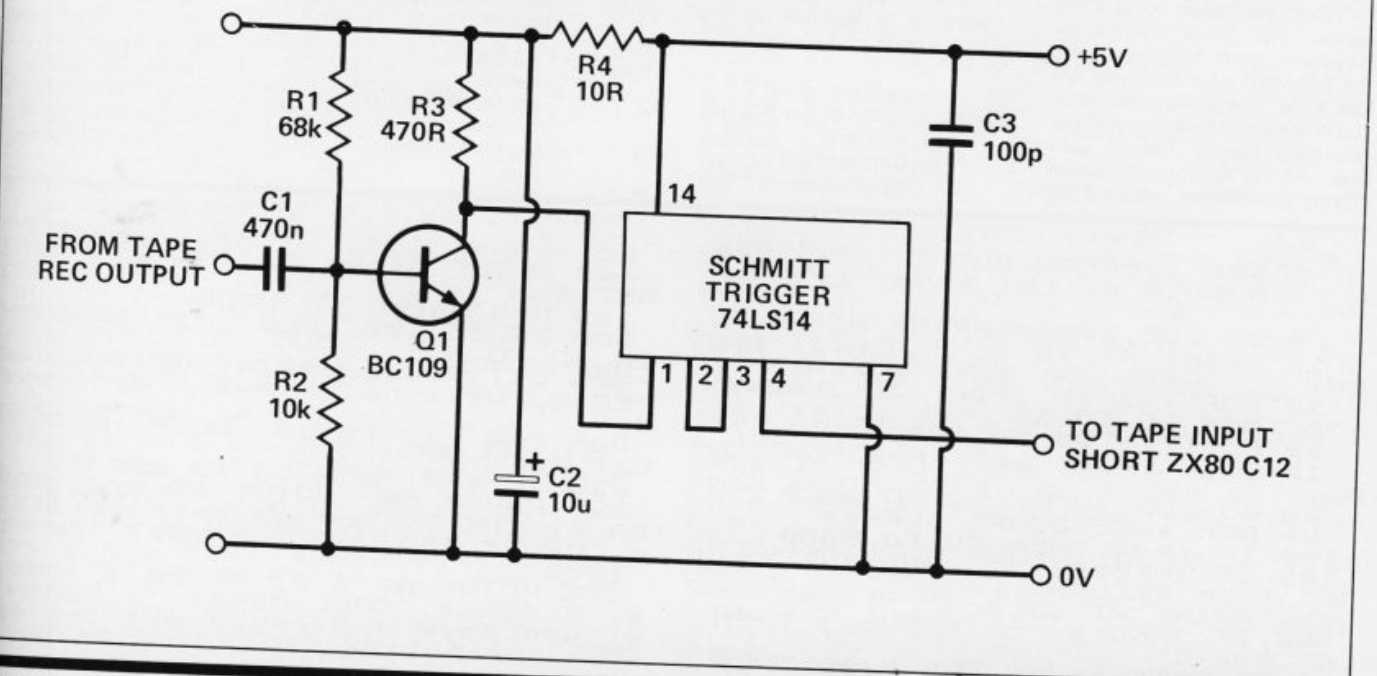

*Fig. 2. This circuit is for use with low level output from the tape deck. Adjust R1 and R2 for different outputs from the tape deck. This circuit was designed to operate with a Sanyo 5050G deck, 580mV at 5.6K output.*

# Spectrum breakout

NOW AVAILABLE FROM ASP SOFTWARE
See page 114 for further details

## Here's a program written by David Spencer of Spalding for all you Spectrum owners who fancy a spot of demolition.

Based on the 16K ZX Spectrum, this game takes just over 6K of memory and makes full use of the sound and colour available on the machine.

The wall itself comprises three different coloured layers, each with 30 bricks. When 60 bricks have been knocked out, a new wall appears and the scores for each layer increases.

When you begin to play the game, you have five lives. However, each time you miss the ball with your bat, you will lose a life. The game ends when you have cleared all five walls or you have lost all five of your lives. All the appropriate sound effects have been included for when you hit the ball with your bat and when you knock out a brick from the wall.

When the game is not being played, the program cycles through a sequence of two explanation pages followed by a demonstration game in which the computer guides the bat. The highest score and the relevant player's name is displayed on screen at this time.

Here is a list of all the variables used in the program.

| | |
|---|---|
| HS | – Highest score. |
| N$ | – Name of the highest scorer. |
| F | – General FOR . . . NEXT counter. |
| FP | – Play flag (1 for the demonstration game). |
| P | – X co-ordinate of the bat. |
| W | – Wall number. |
| S | – Score. |
| ES | – Temporary INPUT string. |
| X,Y | – Co-ordinates of the ball. |
| DX,DY | – Movement vector for the ball. |
| FL | – Flag for sound effects. |
| FT | – Flag for hitting top of screen. |
| FA | – Flag for hitting bat. |
| L | – Lives. |
| A | – Variable to indicate which layer has been hit. |
| J | – Set to 0 for game, 8 for demonstration game. |
| C | – Code of character at ball position. |
| H | – Number of bricks knocked out. |
| P1 | – Required position of bat during demonstration game. |
| DP | – Direction of bat movement during demonstration game. |
| YT | – Temporary variable used in determining P1. |

*SPECTRUM MONITOR
*SPECTRUM EDITOR/ ASSEMBLER
*ZX81 SCREEN KIT 1
*ZX81 ZX-MC *ZX81 REMLOAD

## FAST MAIL ORDER-SEND TODAY!

**SPECTRUM MONITOR. Machine Code Debug/Disassembler**
• Enter, Run, Debug machine code programs. • Compatible with Basic • Breakpoints and Registers Display • Disassembly to screen and/or ZX Printer • 16K and 48K versions on one cassette + 30 page manual. **£7.50**

**SPECTRUM EDITOR/ASSEMBLER. A powerful and essential machine code programming aid.**
16K & 48K on same cassette with full documentation. Major features include:
EDITOR with Auto Line Numbering: 40 Column screen display, tabulated into fields for easy reading: 5 character Label Names: simple Line Editing and Cursor Control: SAVE/LOAD Text Buffer to cassette: output to ZX PRINTER.
TWO-PASS ASSEMBLER accepts all Z80 mnemonics (plus many unpublished mnemonics): Decimal or Hex numbers: simple arithmetic on operands: Assembler Directives — ORG, END, DEFB, DEFW, DEFS, DEFL, EQU, DEFM.
WE CANNOT FULLY DESCRIBE THIS IMPORTANT UTILITY HERE, AND ASK YOU TO SEND A S.A.E. FOR COMPLETE DETAILS OF THIS AND ALL OUR PROGRAMS. **£8.50**

**ZX81 SCREEN KIT 1. More power to your screen in all your Basic programs**
BORDERS any size, anywhere on screen. SCROLL in all 4 directions. CLEAR and REVERSE PART OF SCREEN. FLASHING CURSOR anywhere on screen — simulates INPUT. DATA FILES SAVE AND LOAD Basic variables. Double Speed. 880 bytes machine code for INSTANT RESPONSE. Becomes part of Basic Program. **£5.70** 4K to 64K

**ZX81 ZX-MC. Machine Code Debug/Monitor**
• ENTER, RUN, DEBUG machine code programs • SAVE, LOAD, VERIFY at double speed • BREAKPOINTS and REGISTERS DISPLAY • Self contained — cannot be used with Basic • Cassette plus 36 page manual. **£7.50** 4K to 64K

**ZX81 REMLOAD. Machine Code Debug/Monitor**
• A version of ZX-MC without the Save/Load/Verify facility • Compatible with Basic • CREATE A REM LINE of any length • BREAKPOINTS and REGISTERS DISPLAY • Cassette plus 30 page manual **£6.95** 16K to 64K

**SEND S.A.E. NOW FOR DETAILS**
**6 Corkscrew Hill, West Wickham, Kent BR4 9BB.**

Prices include VAT & P&P

# MICROSPHERE

MICROSPHERE COMPUTER SERVICES LTD
72 ROSEBERY ROAD · LONDON N10 2LA
TELEPHONE 01-883 9411

**OMNICALC** (48K Spectrum) - The very best spreadsheet analysis program you can buy for the Spectrum. Uses include financial planning, home budgets etc. - in fact any work with figures.
Up to 99 columns or 250 rows * supports ALL the mathematical functions * All input is prompted * Separate headings always available so you know precisely where you are! * Extensive repeat facilities reduce the time spent in setting up models Allows conditional expressions (for tax bands etc.) and RND (for simulations) * Totalling and sub-totalling facilities * Complete with comprehensive manual. £9.95

**ZX-SIDEPRINT** (Spectrum and ZX81 versions) - Don't be limited to 32 characters on a line with your Sinclair printer. Using ZX-SIDEPRINT you can print sideways to give any line-width. It is easy to add to existing programs, includes routines to take print lines direct from the screen, and can even print in lower case from a ZX81! (State version rqd) £4.95

**CREVASSE + HOTFOOT** (Spectrum 16K) - Two original games using the Spectrum's abilities to the full. In CREVASSE you are on the ice-cap with chasms opening and closing all around you. Can you make it across the perilous ice? In HOTFOOT you must help a rabbit get to the carrots in the fields around its burrow. But the fields are dangerous, and the plumper the rabbit the greater the danger. The only safety (and the only way to score!) is to get back to the burrow. Now.....where was it? £4.95

**EVOLUTION** (48K Spectrum) - Starting from the primaeval soup, can you retrace the course of evolution and end up with man? Can you keep the earth's eco-systems in balance, respond to climatic changes and survive the odd cataclysm? It should be easy ... after all it has been done before! £6.95

**CASSETTE LABELS** - If you write programs yourself, or want to find a special gift for someone who does, why not have your own cassette labels printed complete with logo? Prices start at only £4.95 for 50 labels or £7.95 for five C20 cassettes with labels fitted. Send s.a.e for design and order form.

# SAVE IT!

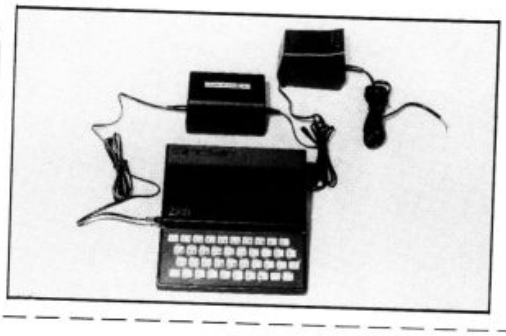
## FOR ZX 81 AND SPECTRUM COMPUTERS

(AND OTHER MODELS USING 9v DC ADAPTORS)

with battpack©
(Patent applied for)

Only £13·95 + £1·40 p/p

**PROTECT YOUR PROGRAMMES WITH THIS RECHARGEABLE BATTERY PACK**



**AT LAST!** The answer to one of the major problems facing personal computer programmers and users; — **POOR MAINS SUPPLIES CAUSING HAVOC, WHILE YOU SPEND HOURS TRYING TO ENTER YOUR CAREFULLY PREPARED PROGRAMMES.**

Now Adaptors and Eliminators, who have produced nearly 70% of all ZX Mains Adaptors, bring you **BATTPACK** — a rechargable 9v Ni-Cad battery pack and transient suppressor, housed in a complementary black ABS case that simply plugs into your ZX adaptor in seconds.

**BATTPACK** ensures the voltage into your ZX computer never drops below 9v, thereby eliminating the possibility of a programme crash because of a split second mains dropout! (One cycle is all it needs!)

**BATTPACK** also suppresses transients and RFI using carefully selected capacitors. Your ZX Adaptor keeps the **BATTPACK** at full charge even when in use — so its always ready for emergencies. Even in the event of a full power cut **BATTPACK** will run your ZX computer for at least 30 minutes giving you time to save your programme on a cassette or print a hard copy on your ZX printer.

**BATTPACK** comes complete with all connecting leads and is ready for use.

**ORDER NOW — SAVE NOT ONLY YOUR PROGRAMMES BUT ALSO YOUR TEMPER!!**

MAIL ORDER ONLY. PLEASE ALLOW 28 DAYS FOR DELIVERY.

ADAPTORS AND ELIMINATORS LTD, 14 THAMES ST, LOUTH, LINCS.
PLEASE SUPPLY_____(QTY) battpack/s

| 7 | PLAYER | 6 |
| | RABBIT | 12,8 |

YOU LOSE 7 TO 23

I've got two programs to look at for the 16K ZX81, both of which are a little different from the run of the mill stuff. First, we have Awari (no, this is not a mis-spelling of a certain well-known computer company) which is available from Understanding Limited (they must have LOADing problems too!!) for £5.95. There are various prizes to be won depending on where you buy it. The second program is called Pilot, which is available from the people at Hewson Consultants for £5.95.

I shall start with Awari, which is an ancient African game of logic. The game is played using 14 'bowls' each of which may hold any number of 'beans'. Bowls numbered 1 to 6 belong to you, ie you can move the beans out of them, and your 'home' bowl is number 7 on the right. Your objective is to get as many beans into bowl 7 as possible and so to beat the computer. Similarly, bowls 8 to 13 at the top 'belong' to the ZX81, and bowl 14 on the left is its 'home'.

The idea of the game is that you may choose one of the bowls numbered from 1 to 6, which contain at least 1 bean, remove them and place them one at a time in the bowls to the right and anti-clockwise. The ZX81 then chooses from bowls 8 to 13 and moves to the left and anti-clockwise. When you get more proficient, you can investigate the more complicated moves. There are three levels of play, which will accommodate an intelligent eight year old to an adult.

Though the game is basically quite simple, it is more addictive than most non-high-speed games are. The game is well set out and has a good amount of intelligently used graphics.

In conclusion, though it is not the most sophisticated ZX81 program on the market, Awari is ideal for all the family. By the way, it LOADed first time.

Awari is priced at £5.95 and is available from Understanding Ltd, The Production Village, 100 Cricklewood Lane, London NW2 2D5.

### Come fly with me

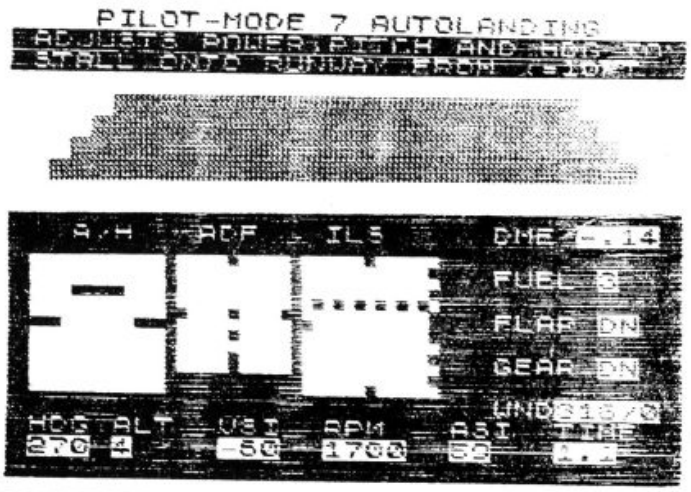
Pilot is a new flight simulation program from Hewson Consultants, written for the ZX81. There is also a ZX Spectrum version available for the same price of £5.95, which is fundamentally the same but with graphics more suited to the capabilities of the Spectrum.

The idea behind a flight simulation program is that you are piloting your own aircraft and are in total control over it. First, you can take off using the navigation beacons, maneouver your way through mountains using the detailed direction finding equipment, and while battling against the forever-changing tropospheric conditions, you must land using manual control or autopilot. Never is life made easy for you, with an astounding, and at times confusing, array of dials, counters, and controls. Unlike most other flight simulation programs for the ZX81, you don't just have the standard altitude, distance and speed commands, but an array including: Artificial Horizon, Automatic Direction Finder, Instrument Landing System, Wind direction and speed, heading, VHF Omni Directional Range...and the list goes on.

The game is definitely not easy and warrents good and extensive instructions. The actual instructions are available in sufficient quantity, but they are not particularly exciting or easy to understand. This was not written for the bloke who wants the next step up from 'Space Invaders' or 'Pacman', but it is more of a thinking person's game. I was surprised by the statement in the instructions which read: 'This program is not a game'. This is a strange thing to say as it fulfills all the attributes which normally are assigned to the word 'game', in that it is a contest in which skill is required and is done as a pastime, rather than as work.

The program is very well written and the graphics are pretty good for the ZX81, though some people may get bogged down with the instructions. If you are interested in this type of game, then I can recommend it as the best one that I have seen on the market for the ZX81 so far.

Pilot is priced at £5.95 and is available from Hewson Consultants, 60a St. Mary's Street, Wallingford, Oxon OX10 0EL.



## ZX Computing software

# Typing Traumas?

Tired of typing - why not let ASP Software take the strain?

We have gathered together four great programs from this issue of ZX Computing and put them all on one tape. Each tape is tried and tested, and would be a welcome addition to your software library.

Spectrum Breakout - You have five chances to demolish the multi-coloured wall.

Defending your Spectrum - Defend the Earth from the invading aliens.

Drainpipes - A Spectrum adaptation of the classic mechanical arcade game.

Spectrum Maze - All you have to do is to get out of the maze as quickly as you can. Sounds easy...

The tape is now available at £5.99 inclusive of VAT and postage and packing. To obtain one of these tapes, simply fill in the form and return it to the following address:

ASP Software,
ASP Ltd,
145 Charing Cross Road,
London WC2H OEE.

Please send me ..... tapes

I am enclosing my (delete as necessary) cheque/ Postal Order/ International Money Order for £.....
(made payable to ASP Ltd)

Now. . . the computer magazine you can understand.

We're booting out the jargon to give you facts that make sense.

Micro Update will be your one-stop guide to the micro scene — whether you're a home user or if you run your own business.

Every month we'll tell you what's best and what's best to avoid among the flood of micro products.

And our feature articles will be packed with information you can use. Our news pages will keep you up-to-date and our buyers' guides will be concise.

Micro Update has invented a new computer language. It's called English.

Just 75p will buy you our translation. Micro Update. . . the micro magazine that makes sense.

# Micro UPDATE

*Published by Argus Specialist Publications Ltd.*

# Battle of Britain

A strategic Wargame for the 48K Spectrum

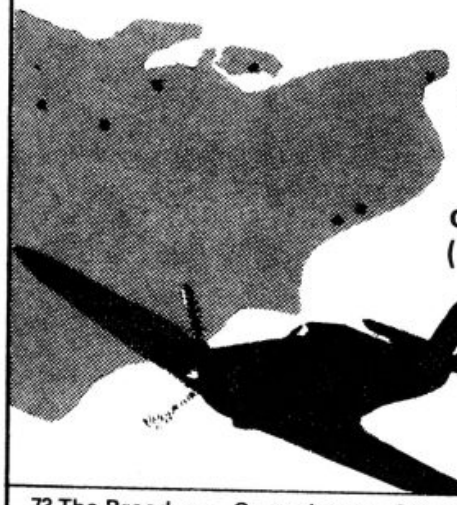
One day in summer, 1940. Reports are coming in of enemy bomber squadrons crossing the English coast; target unknown.

How are you to deploy the nine fighter squadrons under your command to intercept the incoming threat!

British and enemy squadron movements are plotted on a superb high resolution screen map of south east England with communications signals presented both visually and in morse code.

Features variable difficulty levels, full control of squadron movements, randomly selected targets and bomber routes for each game, intelligence reports, refuelling etc.

A tense game of strategy for one player.



48K Strategic Wargame

# HOME SECURITY UNIT

Every **90 seconds** a home is broken into

## NOW USE YOUR ZX81 AS A BURGLAR ALARM

- Everything you need:— *Includes* sensors, pressure pads, program, home security board, and full instructions.
- Simple and easy to install. Fully assembled.
- No television needed to run.
- Fully expandable.
- Less than the cost of a conventional non-computerised system.

## HOME SECURITY UNIT

**£49.95 plus VAT plus £2.00 p&p**

FOR FURTHER DETAILS WRITE TO:

**LOVEDAY COMPUTERS LTD**
Tremadart Close, Duloe,
Liskeard, Cornwall.
or Telephone: **05036 3170**

or send cheque/money order for

**£59.44**

for your Security Unit

# ZX Workstations.. for Spectrum & ZX81

These stylish plinths, in tough moulded ABS, will raise and tilt the TV for better viewing, and angle the computer for easier typing. The power supply is fixed underneath. The printer can be used with the Spectrum version, the RAM with the '81', and the cassette player with both. Full details from: Peter Furlong Products, Unit 5c, South Coast Rd Ind. Estate, Peacehaven, Sussex BN9 8NA. Tel (07914) 81637

# SOUND with SINCLAIR

## MAKE AMAZING SOUND EFFECTS WITH YOUR ZX 81, TIMEX Sinclair 1000 or SPECTRUM

## THE ZON X

**£25.95** incl p&p & VAT

- The ZON SOUND UNIT is completely self-contained and especially designed for use with the ZX 81, TIMEX Sinclair 1000 and Spectrum Computers. It just plugs in — no dismantling or soldering.
- No power pack, batteries, leads or other extras.*
- Manual Volume Control on panel — ample volume from built-in loudspeaker.
- Standard Sinclair — 16K Rampack or printer can be plugged into ZON X Sound Unit without affecting normal computer operation.
- Huge range of possible sounds for Games, Music, Helicopters, Sci-Fi, Space Invaders, Explosions, Gun-shots, Drums, Planes, Lasers, Organs, Bells, Tunes, Chords, etc., or whatever you devise!
- 8 full octaves. Uses 3-Channel sound chip giving programme control of pitch, volume of tones and noise, all with envelope control.
- Easily added to existing games or programmes using a few simple "BASIC" lines or machine code.
- No memory addresses used — I.O. mapped.

**FULL instructions with many examples of how to obtain effects and the programmes, supplied. Fully guaranteed. British Made.**

*Except with Spectrum, you need the Spectrum Extension Board Order No. SE1 - **PRICE £6.80 inc. VAT.**

Payment may be made by Cheque, P.O. Giro No. 388 7006, Postal Order or Credit Card.

Export orders - Bank Cheque, International Money Order, U.S. ★ or £ Sterling.

**BI-PAK** Dept Z.X., P.O. Box 6, 63A, High Street, Ware, Herts.

Access & VISA accepted Ring 0920 3182 for immediate despatch.

# MICHAEL ORWIN'S ZX81 CASSETTES

## THE BEST SOFTWARE (BY VARIOUS AUTHORS) AT LOW PRICES

### QUOTES

"Michael Orwin's £5 Cassette Two is very good value. It contains 10 stolid well designed games which work, offer plenty of variety and choice, and are fun." *Your Computer*, May '82

"Michael Orwin has built a reputation for value-for-money software and his Cassette 4 offers quantity as well as quality." *Sinclair User*, October '82

"If each game was on a separate tape and selling for £5 each I would still recommend them. But all on one for £5 . . . ! This sort of value for money just has not been seen before on any personal computer."

"Without sounding pushy I would like to conclude this review by saying — if you have a ZX81 and like games, then you should buy Michael Orwin's cassette 4." 2 extracts from *ZX Computing*, Oct/Nov '82

### CASSETTE 1
(eleven 1k programs)

machine code:
React, Invaders, Phantom aliens, Maze of death, Planet lander, Bouncing letters, Bug splat.
Basic:
I Ching, Mastermind, Robots, Basic Hangman PLUS Large screen versions of Invaders and Maze of Death, ready for when you get 16k.
**Cassette One costs £3.80**

### CASSETTE 2
Ten games in Basic for 16k ZX81

Cassette Two contains Reversi, Awari, Laser Bases, Word Mastermind, Rectangles, Crash, Roulette, Pontoon, Penny Shoot and Gun Command.
**Cassette Two costs £5**

### CASSETTE 3
8 programs for 16k ZX81

**STARSHIP TROJAN**

Repair your Starship before disaster strikes. Hazards include asphyxiation, radiation, escaped biological specimens and plunging into a Supernova.

**STARTREK** This version of the well known space adventure game features variable Klingon mobility, and graphic photon torpedo tracking.

**PRINCESS OF KRAAL** An adventure game.

**BATTLE** Strategy game for 1 to 4 players.

**KALABRIASZ** World's silliest card game, full of pointless complicated rules.

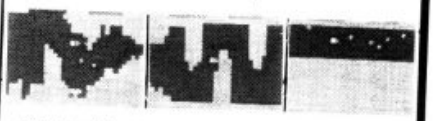
**CUBE** Rubik Cube simulator, with lots of functions including 'Backstep'.

**SECRET MESSAGES** This message coding program is very txlp qexi jf.

**MARTIAN CRICKET** A simple but addictive game (totally unlike English cricket) in machine code. The speed is variable, and its top speed is very fast.
**Cassette 3 costs £5**

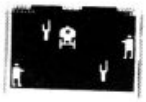
### CASSETTE 4
8 games for 16k

**ZX-SCRAMBLE** (machine code)

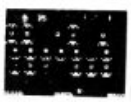


Bomb and shoot your way through the fortified caves.

**GUNFIGHT** (machine code)



**INVADERS** (machine code)



**GALAXY INVADERS** (machine code)
Fleets of swooping and diving alien craft.

**SNAKEBITE** (machine code)
Eat the snake before it eats you. Variable speed (very fast at top speed).

**LIFE** (machine code)
A ZX81 version of the well known game.

**3D TIC-TAC-TOE** (Basic)
Played on a 4x4x4 board, this is a game for the brain. It is very hard to beat the computer at it.

7 of the 8 games are in machine code, because this is much faster than Basic. (Some of these games were previously available from J. Steadman).
**Cassette 4 costs £5**
**FUNGALOIDS** (Machine code)

Recorded on quality cassettes, sent by first class post, from:
**Michael Orwin, 26 Brownlow Road, Willesden, London NW10 9QL** (mail order only please)

# Mastermind '80

**Ian Turtle presents us with a ZX80 version of the popular game.**

The computer first selects four different random numbers from the limits you suggest — you then have ten rounds in which to guess the hidden code.

Each round consists of you inputting your guess by typing each number and pressing Newline. As the ZX80 accepts each each number, your guess will be displayed on the screen.

The number of black and white pegs you are awarded is then worked out once you have guessed four numbers; a black peg is awarded for each number correctly placed in the code, a white peg for each correct number but wrongly placed. Your aim in the game is to achieve four black pegs thus signifying four correct numbers in the right order.

There is a display of all your previous guesses and the black and white pegs awarded, to help you make your next decision.

Note that the symbol ⁎ is used in the listing to indicate a space where it is not obvious (usually in PRINT statements before semi-colons).

```
20  RANDOMIZE

# Spectrum maze

## Bill Longley of Colchester has written a program for you to lose yourself in your 16K Spectrum.

The game's object is to get out of the maze in the shortest time. This is not quite as simple as it sounds as you can only see a quarter of the maze at any one time, and the whole thing is four screens long rather than the usual one. The way this is done is by moving the maze to the left or right rather than moving you. Normally, this would be very slow, so the movement is done by machine code. So is the actual printing of the maze, and this means there is approximately an eighth of a kilobyte of machine code.

Changing a part of the maze is very easy. Each DATA statement from 2000 to 2117 controls one column on the screen. The screen is divided into three groups of eight lines. Then, each square in the column is coded into a binary digit – a black square is one, a white square is zero. Finally, each group of eight squares is converted into a decimal number between zero and 255, and the three numbers derived like this are entered into the DATA statement. Have a look at Fig. 1 if you still don't understand.

Four of the routines which are in machine code can be used in your own programs. These are as follows:

Line 1: Moves the colours one character to the left. The starting address is 23760.
Line 2: Moves the colours one character to the right. The starting address is 23798.
Line 3: Smoothly moves the actual characters to the left by one square (scrolls by one pixel each time, for eight times). The starting address is 23836.
Line 4: Smoothly moves the characters to the right by one square (scrolls by the same methods as used in line 3). The starting address is 23876.

The fifth line is also machine code, but is of no use outside this program. If these routines are all that are wanted, just enter lines 1 to 4, 6 to 9, and 100 to 460. RUN them, then delete all the lines from 6 onwards. (The machine code will stay in place in the REM.)

### How to play

The game uses the four cursor keys in the usual way. Setting up the screen takes about thirty seconds, then you appear as the letter 'A'. You can programme this to be any shape you want. Be careful of memory when you make any additions to the program – I used most of it for the maze. You have about 1K left; however, someone with the 48K Spectrum though, can make the maze up to 32 screens in length! But as this means that over a thousand DATA statements have to be typed in, you'll need strong fingers.

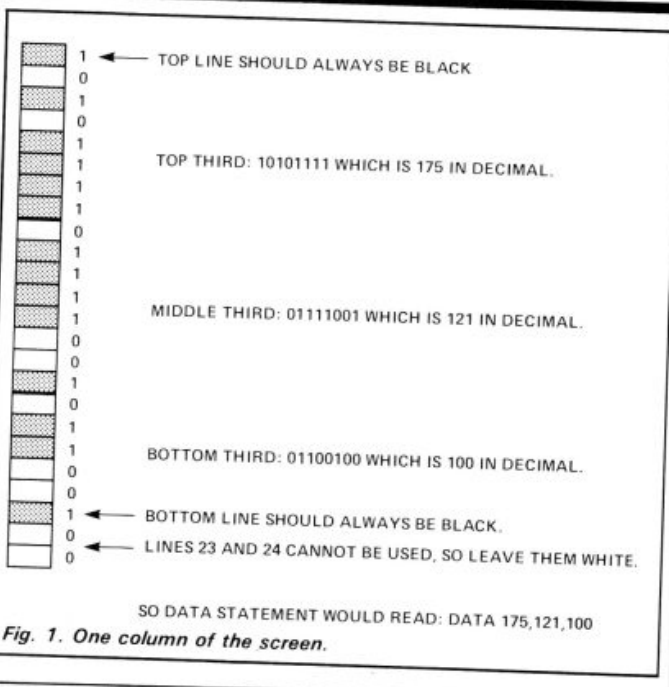

*Fig. 1. One column of the screen.*

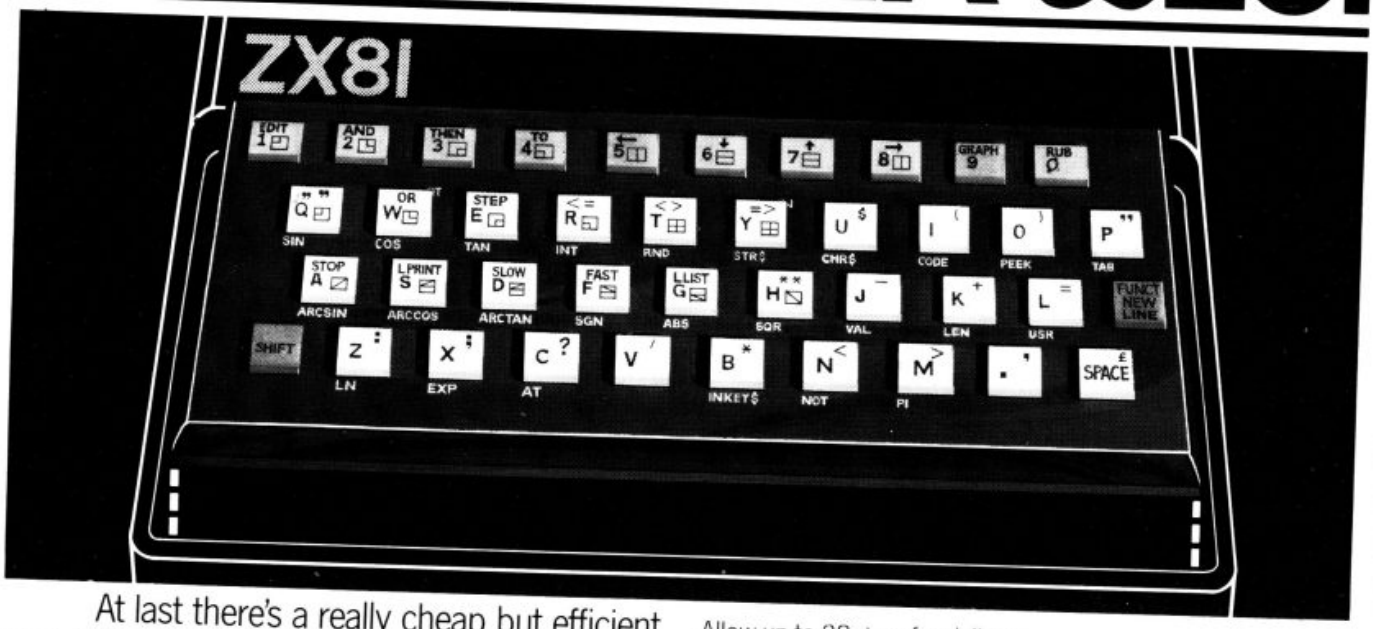
# NOW. A ZX81 PUSH-BUTTON KEYBOARD FOR UNDER £10.



At last there's a really cheap but efficient way of ironing out the ZX81's only real bug: its keyboard. The Filesixty Buttonset offers

- A full-travel calculator-type moving keyboard for only £9.95.
- Installed in seconds. The peel-off adhesive backing means you just register into position and press.
- No messy labels, dismantling or soldering.
- 3 groups of colour keys to pick out shift, numerals and newline.
- Precision moulded in ABS to match your ZX81, with contrasting legends for maximum legibility.

Allow up to 28 days for delivery.
Orders to Filesixty Ltd., 25 Chippenham Mews, London W9 2AN.

Cheques/PO made payable to Filesixty Ltd.

Please send me_____ (qty.) Buttonset(s) at £9.95 each (including VAT and P&P).

# Educational software

**For those of you looking for some good educational software, David Valentine airs his views on the subject and reaches a very worthwhile conclusion.**

To anyone who believes in computers and who understands the impact that computers are going to have on the lives of nearly everyone, it might come as something of a surprise to find that the vast majority of teachers are unaware of what computers can do to assist and enrich the learning situation. It would probably come as an even greater surprise to find that there is active resistance to the introduction of computers into the classroom. Even in some of those schools where computers have been purchased, they have been put into a separate room with restricted access to them, and are 'taught' as a separate subject, just like 'Geography' or 'Science'.

There are two questions which need answering here. One is 'Why is there such a reluctance on the part of schools to purchase computers on any scale?', and the second is 'Why are computers so badly used in schools that have purchased them?'.

With the coming of the ZX range of computers, cost can no longer be cited as the prime reason for not purchasing computers. Now that a ZX81 plus a 16K RAM pack can be purchased for as little as £75, it is possible for a school to obtain eight for the cost of one of the more usual school computers.

## Catch 22

I am convinced that the answer to both questions is tied up with a general lack of suitable educational software. There are many programs on the market which are supposed to be educational. A number of companies invite respectability by tagging some pseudo-educational programs on to the end of their ranges. These programs are quite easy to spot as they are invariably of the 'quiz' type with the computer posing test questions and the child keying in answers usually from a multiple choice list. These programs are not educational; they may be fun to use once or twice, but they usually prove to be of little use for a teacher or parent to use on a regular basis.

Why is it then that there is precious little educational software available at present? There are a number of reasons. One is that there is very little profit to be made from writing such software. Whilst 'space invader' type programs sell in their thousands, even the most successful maths packages sell in only hundreds! The main problem is, however, a lack of suitable software authors. The best people to write such software are, presumably, teachers. Teachers, however, tend to be rather a conservative set of people and with teachers unsure of using them in the first place, we have a 'catch 22' type situation.

## This is what they want

What then makes a good educational software package? Firstly it must be easy to use and understand. It is simply a waste of time to produce a program that makes superb use of a computer's graphic capabilities or uses some very clever programming technique if the user cannot understand how to operate it. Secondly, the program should teach or test a topic at least as well as existing methods. Computers will remain underused, gathering dust in stock cupboards, if they cannot significantly improve on a teacher's skill at the blackboard. Thirdly, the programs should be well error trapped. It is not good enough for a program to crash out when an inexperienced user is working with it. It is the same as when a film snaps in a projector — it totally disrupts the flow of the lesson and valuable time is lost. Unreliable technology, whether hardware or software, is soon consigned to the scrapheap in schools!

Fourthly, the programs should be well documented. This should include such simple information as to how to load the program, what the program is about and what age range it is intended for. It should also indicate what options are open to the user and wherever possible, how the program could be adapted to be used in different situations. It should go without saying that the program should be stimulating and visually well-presented. When, and only when, there are large banks of software dealing with all subject areas, dealing with many areas within a subject, to teach, test, illustrate and record, will computers emerge from the safety of their own suites and become commonplace in the ordinary classroom.

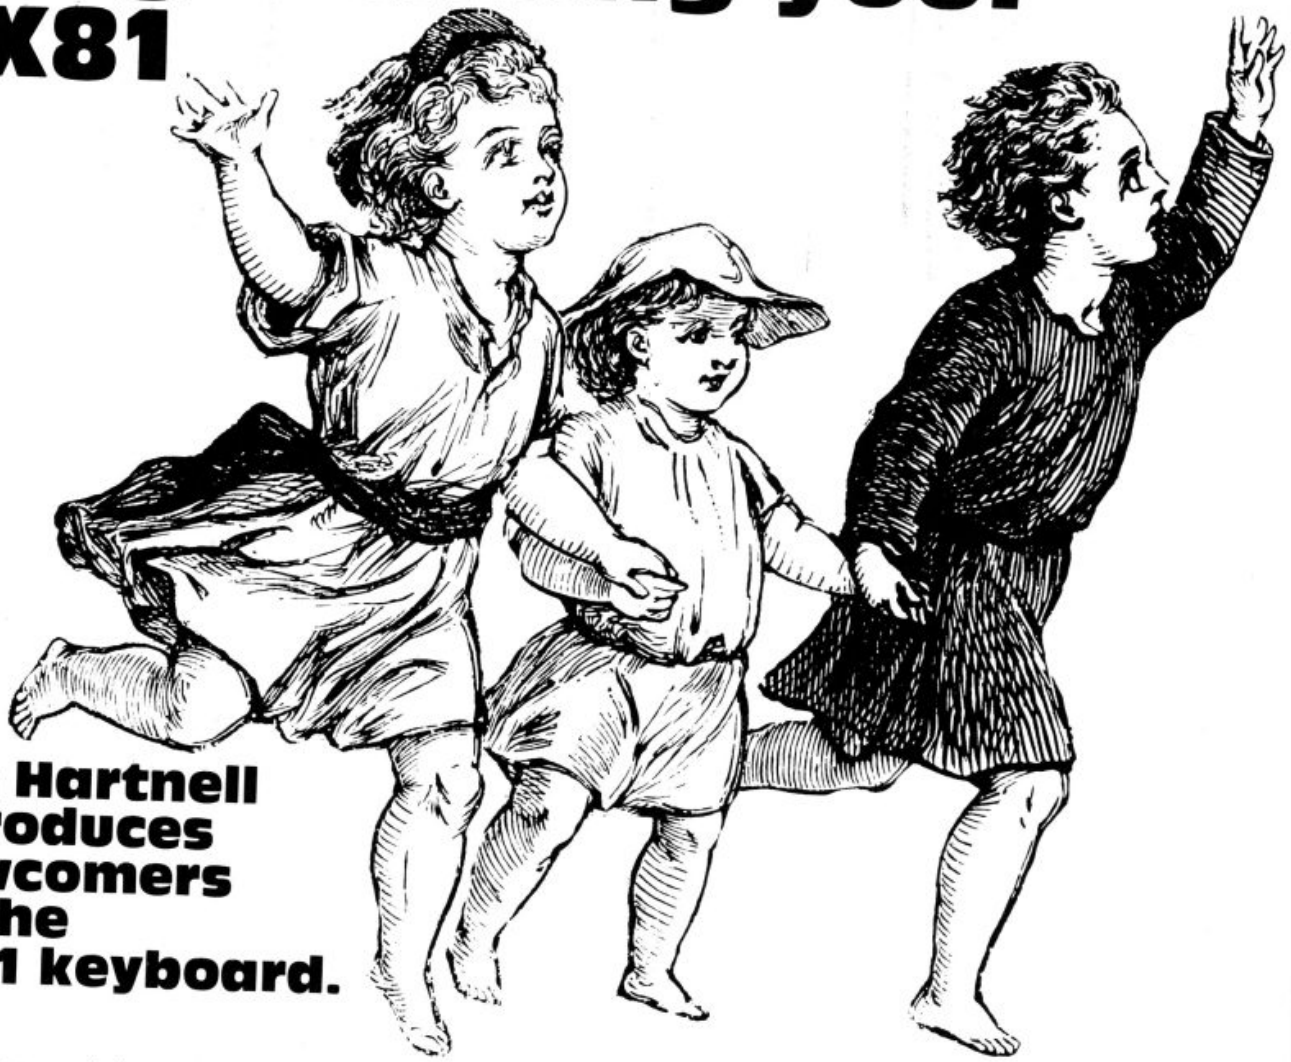
## Look and learn

How can teachers and parents find what is available at present and how suitable the available software is? Now that there are an increasing number of shops who specialise in home computers, with the emphasis on the 'ZX' range, such as Microware of Leicester or the Buffer Shop in London, it ought to be possible to see educational programs demonstrated. Another method of ascertaining the suitability of software is to study the impartial and thorough reviews in computing publications.

There are a few software companies who specialise in the production of educational software. The ones who advertise regularly and who have received good reviews of their software are worth contacting for a catalogue. Also, E.Z.U.G., the Educational ZX Users Group, lay down rigorous standards for the acceptance of programs into its library, and is therefore an obvious place to search for available programs.

For those who are dissatisfied with the range and quality of the currently available educational software, there is only one course of action open — *get writing!*

# First steps in programming your ZX81



## Tim Hartnell introduces newcomers to the ZX81 keyboard.

The first time you look at the ZX81 keyboard, you are likely to be in for a bit of a shock. As well as numbers and letters more or less where you would expect them to be on the typewriter keyboard, there seems to be a bewildering collection of odd symbols and words within the key outline, with other words above and below the keys. Trying to work out how to get what you want from a key — and some keys can produce as many as five different results — can seem very difficult.

But it is not. The computer is designed so that it knows, more often than not, which of the five possibilities you will need. And when the computer cannot tell from the context of what you're typing in which part of the key's possibilities you want, it is very easy to instruct it.

Plug in your computer as shown in the manual which came with it. An inverse K (a white K on a little black square) will appear in the bottom left-hand corner. This is called the cursor and it is the key to working out which possibility you'll get when you press a key. If the cursor is a K, you'll get numbers or 'keywords' (the words in white above the keys). We'll look at keywords and the other possibilities in more detail shortly. If the cursor is an inverse L, the keyboard works more or less like a typewriter. That is, you press the S key, and the letter S appears on the screen. The other two possibilities for the cursor are an F (function mode) or a G (graphics mode).

The Shift key (the one with the word SHIFT in red, in the bottom left-hand corner of the keyboard) allows you to get the words and symbols written in red on the keys, as you'll see in a moment.

### Slow / Fast

When you first turn the computer on, it is in Slow mode. In Slow mode, looking after the smoothness of the television picture is considered more important than 'thinking', so the computer does its thinking between sending picture information to the television. The great majority of ZX81 programs, like nearly all those in this issue of *ZX Computing*, are designed to be run in Slow mode, so the computer is in the correct mode for running them automatically.

In Fast mode, the computer's thinking is considered more important than looking after the picture, so it can become very jerky.

However, it is much easier to enter a program into the ZX81 when it is in Fast mode, so we need to be able to switch between modes at will — Fast to get a program into the computer and Slow for RUNning it.

As I said, the computer is in Slow mode automatically when you turn it on. To get it into Fast mode, press on the Shift key (remember, it's the bottom left-hand corner of the keyboard) then press the F key (which, as you'll see, has the word FAST written on it in red). The word FAST should appear on the screen. Now press the Enter/Newline key (second from the bottom, on the right-

hand side), and you'll see the screen jump, and the 'message' 0/0 appear in the bottom left-hand corner of the screen. This message -- 0/0 — means 'all OK'.

Now press any key, and you'll see the display jumping about. This is what Fast mode looks like; far less attractive to watch, but far easier to use for program entry.

You may find when you write your own programs that the speed of Slow is, in fact, too slow for your liking. This can happen when the computer must do a great deal of work to determine an answer, and in this sort of program — when the display is less important than getting a quick answer — you should run your programs in Fast. However, for many programs (such as the majority of those in this magazine), the ZX81 is still fast enough in Slow for our needs.

To get back into Slow mode from Fast, hold down the Shift key again, then press the D key (where the word SLOW is written in red). The display will 'lock on', and the 'all OK' message will appear on the screen. From now on, we'll assume that you have your computer in Fast mode when you enter programs, and in Slow mode when you RUN them.

## Keywords

The words written in white *above* many of the keys are 'keywords'. These are the fundamental words from which programs are built — the main building blocks of your programs. When you write a program such as you see throughout this issue of *ZX Computing,* you start with a number (the line number), and follow this with a keyword, then generally some additional material.

Here's an example which should help to make that last sentence clear. Make sure your computer is 'empty', which you can do by turning off the power, waiting a few seconds, then turning it on again. This is not the best way to clear the contents of the computer's memory (the word NEW above the A key is designed to do it), but this method is the simplest at this stage.

Once the computer is empty, type in the number 10. It will sit down at the bottom of the screen. The 10 is a line number. Now press the P key, and you'll see the word PRINT appear on the screen, just after the 10. The keywords appear automatically after a line number. Now press Enter (it may be called Newline on your ZX81, as this was used for this key on earlier models), and you'll see the program line move up to the top of the screen, which means it has been accepted by the computer.

## Functions

Functions are the words in white *under* many of the keys. The functions include such esoteric words as LEN, INKEY$ and TAB. You get into the function mode (when the inverse K cursor turns into an inverse F) by holding down the Shift key, then pressing the Enter key, which you can see has the word FUNCTION on it in red, above the word ENTER (or NEWLINE). When you do this, you'll see the cursor has turned into an inverse F. Now press the C key, and the word AT should appear on the screen. Try the B key (to get the word INKEY$) and the P key (to get TAB).

## Operators

The operators are the link and comparison words and symbols like THEN, AND, TO and < > . You get these by holding down the Shift key, then pressing the key the operator you want is on. Clear the computer as before, then hold down the Shift key and press U. The dollar sign should appear. Press 2 and you'll get the word AND, 3 for THEN and 4 for TO.

The word in red on the 1 key — EDIT — has a special function. It is used to bring a line down from the top of the screen (where it has been accepted into the computer's memory as part of a program) to the bottom of the screen so you can change or EDIT it in some way.

To show this in action, clear the computer, then type in the following:

10 PRINT 6

Press Enter and this line will move to the top of the screen. Now hold down the Shift key, and press the 1 key, and the line will reappear at the bottom of the screen. Still holding down the Shift, press the 8 key (where you'll see a little arrow pointing to the right) and you'll see the cursor move across the word PRINT to rest between it and the 6. Press the 8 key again (still holding down Shift) and the cursor will jump over the word 6. The word DELETE (or RUBOUT) is on the 0 key (and note that the zero has a line through it to distinguish it from the letter O). Still holding down Shift, press the 0 key once, and the number 6 will be erased. Take your finger off the Shift and press the 5 key, to see the number 5 appear at the end of the line. What you have (or what you should have) at the bottom of the screen will look like this:

10 PRINT 5

Now press Enter and the line will appear at the top of the screen, taking the place of the previous one.

## Graphics

The final cursor mode we'll discuss is the graphics mode.

Clear the computer's memory with New (Shift, then press the A key so the word NEW appears, then press Enter). Now type in the number 10, then press the P key, so the keyword PRINT appears. You should now have this at the bottom of the screen:

10 PRINT

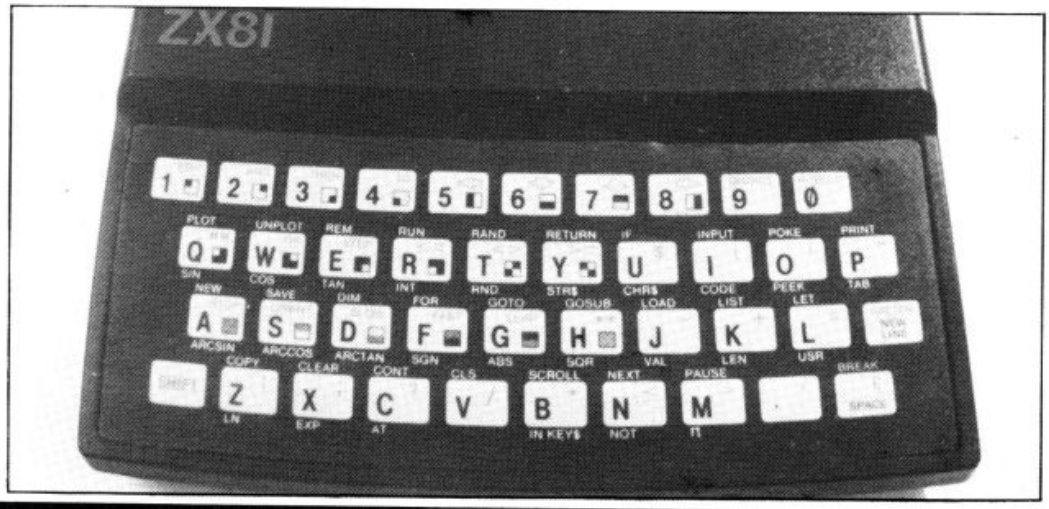
Now hold down the Shift key, and press the P key again, and a pair of quote marks will appear. Still holding down Shift, press the 9 key, and the cursor will turn into a G, meaning the computer is in the graphics mode. Now type in a word, and you'll see it appear in white letters on little black squares, rather than in black letters on the ordinary white background. Holding down the Shift again, press the 9 key again, and the inverse G will turn back into an L. Still holding down Shift, press the P key for the closing quote marks. Now press Enter, and your line (complete with a word in inverse letters) should appear at the top of the screen.

RUN this program (by pressing the R key to get the word RUN at the bottom of the screen, then pressing the Enter key) and your word, in white letters on a little black background strip will appear at the top of the screen.

If you are in the graphics mode, and you hold down the Shift key while pressing some of the keys, instead of an inverse letter you'll get the little patterns and designs on the keys. These can be used to build up pictures.

## All keyed up

Now, I don't expect you'll understand all of this discussion instantly, and hope you'll refer back to this article from time to time as you continue working your way through this magazine. You should, however, find you quickly master the fundamentals of the keyboard, and the need to refer to this introductory article will diminish as time goes by. You may wish to read through the whole of this article again now, before you tackle the programs on other pages.



# GEMINI SOFTWARE

## ZX81 (16K) SPECTRUM (48K) STARTREK

Features an 8 x 8 Galaxy, Klingons and Starbases, short and long range scans, Torpedoes and Phasers, Computer etc.

PLUS Normal or Hyperdrive: choose your speed but watch the energy level.

Galaxy Map: keep track on where you have been. Also, shows whether any Klingons remain there, and where the starbases are.

Visual display of Enterprise's position and movement.

Visual display of photon torpedo.

Messages from crew members.

5 levels of play. And much more.

Cassette plus full instructions.

ZX81 £4.95

Spectrum £5.95 (colour and sound too)

Good software wanted.

*PLEASE STATE COMPUTER*

***We're tired of telling you how good our game is..... let our customers tell you***

*Dear Sir,*

*I received a copy of your Football Manager, Spectrum 48K game a couple of weeks ago and felt I must just write and congratulate you on such an "addictive game".*

*I started on the beginners skill level with Ipswich Town in the Fourth Division. After having played six seasons I am now into the first division having won the F.A. Cup whilst in the second division. All of which took about nine hours of being glued to the screen.*

*Since reaching the first division I have increased my skill level and am now sixth in the table after ten seasons and about 15 hours!*

*The reason I am suprised that I have played this game more than any other in my library over the last two weeks, is because I don't really like watching football on television. I don't even support a team. The structure of your game is such that anyone can play it.*

*P. A. HACKMAN,*

# MICROWARE Leicester

# Do your programs load from tape first time, every time? If not, you need . . .

## (1) THE MICROCOMPUTER USER'S BOOK OF TAPE RECORDING by Hilderbay Ltd.

### CONTENTS

PART I (for everybody: the 'how to' part):
1 How your system should work
2 Choosing a tape recorder
3 Testing and adjusting your tape recorder
4 Keeping your recorder in good condition
5 The selection and care of tapes
6 Making reliable recordings
7 Loading 'difficult' tapes
8 Useful accessories

PART II (more for enthusiasts: the 'why' part)
9 How a tape recorder works
10 Computer cassette interface waveforms
11 Stereo heads, azimuth angle error
12 Miscellaneous tape problems

Price £3.15 incl postage; £2.90 from bookshops. Or ask for it at your library.

## (2) TEST AND ALIGNMENT CASSETTE: £4.90

A precision accessory which enables you to set up the azimuth angle of your cassette recorder head accurately using only a small screwdriver! Azimuth error is one of the commonest causes of tape troubles. With full instructions.

## (3) LOADING AID: £5.95

If your recorder is basically OK, but you have trouble getting the playback level right with tapes from different sources, you need our Loading Aid! Also suitable for checking the quality of tapes, detecting and (sometimes) compensating for dropouts, etc. With full instructions and hints on tape use.

## (4) TAPE RECORDER £22 + £2 postage

Aligned and tested for computer use. A simple, but satisfactory machine.

## SPECIAL TAPE OFFER!

Book + alignment cassette + loading aid for **£11.90**!

All prices include VAT. Everything post free unless stated otherwise. COD orders £2 extra. Access orders accepted by telephone.

# SPECTRUM NEWS FROM ELR

EAST LONDON ROBOTICS

Just received your ZX SPECTRUM? No point in looking any further—we have the products you need at the prices you expect.

## SP48
32K Memory extension
(giving total of 48K. Upgradeable to SP80)

**£25**

## SP80
64K Memory extension
(giving massive 80K)

**£50**

Both the SP48 and the SP80 fit inside the Spectrum case, are fully compatible with all Sinclair add-ons (ZX Printer, RS232, Microdrive etc.), are very low in power consumption, require no soldering, are easy to fit and remove and carry our full guarantee.

Transfer your ZX81 BASIC and machine code programs and data onto your Spectrum in minutes with the fabulous new

## ZX SLOWLOADER
**£10**

SOFTWARE PRODUCT OF THE YEAR

This superb piece of software enables your Spectrum to LOAD programs from ZX81 tapes and automatically converts them to 'Spectrumese' ready for normal Spectrum SAVEing.

Send s.a.e. for **FREE** catalogue to: ORDERS & ENQUIRIES
East London Robotics, Finlandia House, 14 Darwell Close, East Ham, London E6 4BT. Tel: 01-471 3308

## New Generation Software

Professionally Written and Produced Software for the Home Computer

From M.E. Evans, the author of the highly acclaimed **3D MONSTER MAZE** and **3D DEFENDER** for the ZX81 comes

**TWO GAMES FOR THE SPECTRUM**

Available mid-Jan.

**3D TUNNEL** (16K & 48K versions on one tape)
What lies down in the depths of the TUNNEL? Flying bats, leaping toads, spiders*, and rats* maybe. Perhaps more! You will have to avoid the walls of the TUNNEL as it weaves up & down and side to side to find out. All in 3D of course. (* not in 16K version).

**ESCAPE** (Runs in 16K)
Can you ESCAPE from the maze inhabited by 5 hunting Dinosaurs, including a Pteranodon that soars over the maze to swoop down on you.

*"One of the best and most original games we have seen for the SPECTRUM so far"*
SINCLAIR USER.

TRADE ENQUIRES WELCOME AT ADDRESS BELOW

Send to: **New Generation Software, FREEPOST** (BS3433) Oldland Common, Bristol BS15 6BR (no stamp required in U.K.) or for **INSTAND CREDIT CARD** sales ring 01-930 9232 S.A.E. WITH ENQUIRIES PLEASE

Please send me . . . . off 3D TUNNEL/ . . . off ESCAPE, at **£4.95** each (inc. P&P and VAT). I enclose cheque/P.O.

## HIGH QUALITY PROGRAMS TO HELP YOUR CHILD LEARN

PFL is currently testing a new series of educational software and the first programs are now available for sale to run on Commodore and Sinclair micro computers. The software is specifically designed to provide controlled drill and practice in graded exercises for children aged 7–11 in the following subjects:

English
Arithmetic
Verbal Reasoning
Reading and Spelling
(with special consideration for remedial problems)

Each program has been especially designed by highly qualified, experienced educationalists and written by professional programmers. Trials have demonstrated that these programs really stimulate children's enthusiasm and do help them to realise their academic potential. They will be of great value to parents and teachers for normal, advanced and remedial training and also for those preparing children for Common Entrance/Independent School Entry examinations.

For further details please write to PFL at the address below, stating whether you are a parent or teacher, the type of computer available and in which subjects you are interested.

**PROGRAMS FOR LEARNING,**
**Dept. ZX,**
**4 Stanley Road,**

# MACHINE SPECIFICATIONS

## ZX80

Dimensions
Width 174mm (6.85 in)
Depth 218mm (8.58 in)
Height 38 mm (1. 5 in )
Weight 300g (10.5oz)

Microprocessor/Memory
Z80A 3.25 MHz clock
ROM: 4K bytes containing BASIC
RAM: 1K bytes internal, externally expandable to 16K bytes.

Display
Requires an ordinary domestic black and white colour TV. The lead supplied connects between the ZX80 and your TV's aerial socket. The display organisation is 24 lines of 32 characters per line showing black characters on a white screen. The ZX80 does not connect to a printer.

Programming
Programs can be entered on the keyboard or loaded from cassette. The ZX80 has automatic "wrap round" so lines of program can be any length but not multi-statement lines.

Syntax check
The syntax of the entered line is checked character by character. A syntax error cursor marks the first place the syntax breaks down if there is an error. Once any errors have been edited out the syntax error cursor disappears. Only syntax error-free lines of code are accepted by the ZX80.

Graphics
Total of 22 graphics symbols giving 48 x 64 pixels resolution consisting of 10 symbols plus space and inverses. Includes symbols for drawing bar charts. Under control of your BASIC program any character can be printed in reverse field.

Editing
The line edit allows you to edit any line of program or input including statement numbers. The edit and cursor control keys are EDIT, RUBOUT, HOME.

Arithmetic
Arithmetic operators +,−,x, ÷ exponentiate. Relational operators <, >, = , yielding 0 or − 1. Logical operators AND OR NOT yielding boolean result. Relational operators also apply to strings. ZX80 BASIC uses 16 bit two's complement arithmetic ( ± 32767 ).

Variables
Numeric variable names may be any length, must begin with a letter and consist of alphanumerics. Every character in the name is compared thus an infinity of unique names is available.
String variables may be assigned to or from, shortened but not concatenated. String variable names are A$ – Z$. Strings do not require a dimension statement and can be any length.
Arrays have a maximum dimension of 255 (256 elements) each. Array names consist of a single letter A–Z.
Control variable names in FOR. . . NEXT loops consist of a single letter A–Z.

Expression evaluator
The full expression evaluator is called whenever a constant or variable is encountered during program execution. This allows you to use expressions in place of constants especially useful in GOTOs, GOSUBs, FOR. . . NEXT etc.

Immediate mode
The ZX80 will function in the "calculator mode" by immediately executing a statement if it is not preceded with a line number.

Cassette interface
Works with most domestic cassette recorders. The transfer rate is 250 baud using a unique tape-recording format. Other systems are not compatible with the ZX80's. The ZX80 also SAVEs the variables as well as the program on cassette. Therefore you can save the data for updating next time the program is executed. The ZX80 does not support separate data files. The lead supplied with the ZX80 is fitted with 3.5mm jack plugs.

Expansion bus
At the rear has 8 data, 16 address, 13 control lines from the processor and Ov, 5v, 9-11v, $\overline{\emptyset}$ and internal memory control line. These signals enable you to interface the ZX80 to your own electronics, PIO, CTC, SIO if you want I/O ports etc.

Power supply
The ZX80 requires approximately 400mA from 7–11v DC. It has its own internal 5v regulator.

TV standard
The ZX80 is designed to work with UHF TVs (channel 36)and is the version required for use in the United Kingdom. The ZX80 USA is designed to work with a VHF TV(American channel 2. European channel 3) and is the version required for the American TV system, also for countries without UHF.

## ZX81

Dimensions
Width 167mm (6.32 in)
Depth 175mm (6.80 in)
Height 40 mm (1.57 in)
Weight 350 gms (12.15 oz)

Microprocessor/Memory
Z80A 3.25 MHz clock
ROM: Containing 8K BASIC interpreter
RAM: 1K bytes internal, externally expandable to 16K bytes.

Keyboard
40 key touch-sensitive membrane. Using function mode and single press key-word system, this gives the equivalent of 91 keys and also graphics mode allows an additional 20 graphical and 54 inverse video characters to be entered directly.

Display
Requires an ordinary domestic black and white or colour TV. The aerial lead supplied connects the ZX81 to the TV aerial socket. The display is organised as 24 lines of 32 characters with black characters on a white background.

Two mode speeds
The ZX81 can operate in two software-selectable modes - FAST and NORMAL. FAST is ideal for really high-speed computing. In NORMAL mode however the ZX81 allows continuously moving, flicker-free animated displays.

Printer
The 8K ROM will permit instructions (LPRINT, LLIST and COPY) to drive the Sinclair ZX Printer.

Programming
Programs can be entered via the keyboard or loaded from cassette. Programs and data can be saved onto cassette so that they

are not lost when the ZX81 is turned off.
Syntax check
The syntax of a line of program is checked on entry. A syntax error cursor marks the first place the syntax breaks down if there is an error. The syntax error cursor disappears when errors have been corrected. Only lines free from syntax errors will be entered into the program.
Graphics
Apart from the 20 graphics characters, space and its inverse, the display may also be divided into 64 x 44 pixels, each of which may be 'blacked' in or 'whited' out under program control.
Editing
A line editor allows you to edit any line of program or input, including program line numbers. Lines may be deleted, increased or decreased in size.
Arithmetic
Arithmetic operators +, −, x, ÷, exponentiate. Relational operators =, < >, >, <,< =,> =, may compare string and arithmetic variables to yeild 0 (False) or 1(True). Logical operators AND, OR, NOT yield boolean results.
Floating-point numbers
Numbers are stored in 5 bytes in floating-point binary form giving a range of $\pm$ 3 x $10^{-39}$ to $\pm$ 7 x $10^{38}$ accurate to 9½ decimal digits.
Scientific functions
Natural logs/antilogs; SIN, COS, TAN and their inverses;SQR; $e^x$.
Variables

| | |
|---|---|
| Numerical: | any letter followed by alphanumerics |
| String: | A$ to Z$ |
| FOR-NEXT loops: | A–Z (loops may be nested to any depth. |
| Numerical arrays: | A–Z |
| String arrays: | A$ to Z$ |

Arrays
Arrays may be multi-dimensional with subscripts starting at 1.

Expression evaluator
The full expression evaluator is called whenever an expression, constant or variable is encountered during program execution. This powerful feature allows use of expressions in place of constants and is especially useful in GOTO, GOSUB etc.
Command mode
The ZX81 will execute statements immediately, enabling it to perform like a calculator.
Cassette interface
Works using domestic cassette recorders. The transfer rate is 250 baud and uses a unique recording format not compatible with other systems. The ZX81 will save the data as well as the program to avoid the need to re-enter the data when the program is next loaded.,
ZX81 will search through a tape for the required program). The cassette leads supplied have 3.5 mm jack plugs.
Expansion port
At the rear, this has the full data, address and control buses from the Z80A CPU as well as OV, +5V, +9V, $\overline{0}$ and the memory select lines. These signals enable you to interface the ZX81 to the Sinclair 16K RAM pack and ZX printer.
Power supply
The ZX81 requires approximately 420mA at 7–11V DC. It has its own internal 5V regulator. The ready assembled ZX81 comes complete with a power supply. The ZX81 kit does not include a power supply.

TV standard
The ZX81 is designed to work with UHF TVs (channel 36) 625 lines.

# ZX SPECTRUM

**Dimensions**
Width 233 mm
Depth 144 mm
Height 30 mm

**CPU/Memory**
Z80A microprocessor running at 3.5 MHz. 16K-byte ROM containing BASIC interpreter and operating system.
16K-byte RAM (plus optional 32K-byte RAM on internal expansion board) or 48K-byte RAM.

**Keyboard**
40-key keyboard with upper and lower case with capitals lock feature. All BASIC words obtained by single keys, plus 16 graphics characters, 22 colour control codes and 21 user-definable graphics characters. All keys have auto repeat.

**Display**
Memory-mapped display of 256 pixels x 192 pixels; plus one attributes byte per character square, defining one of eight foreground colours, one of eight background colours, normal or extra brightness and flashing or steady. Screen border colour also settable to one of eight colours. Will drive a PAL UHF colour TV set, or black and white set (which will give a scale of grey), on channel 36.

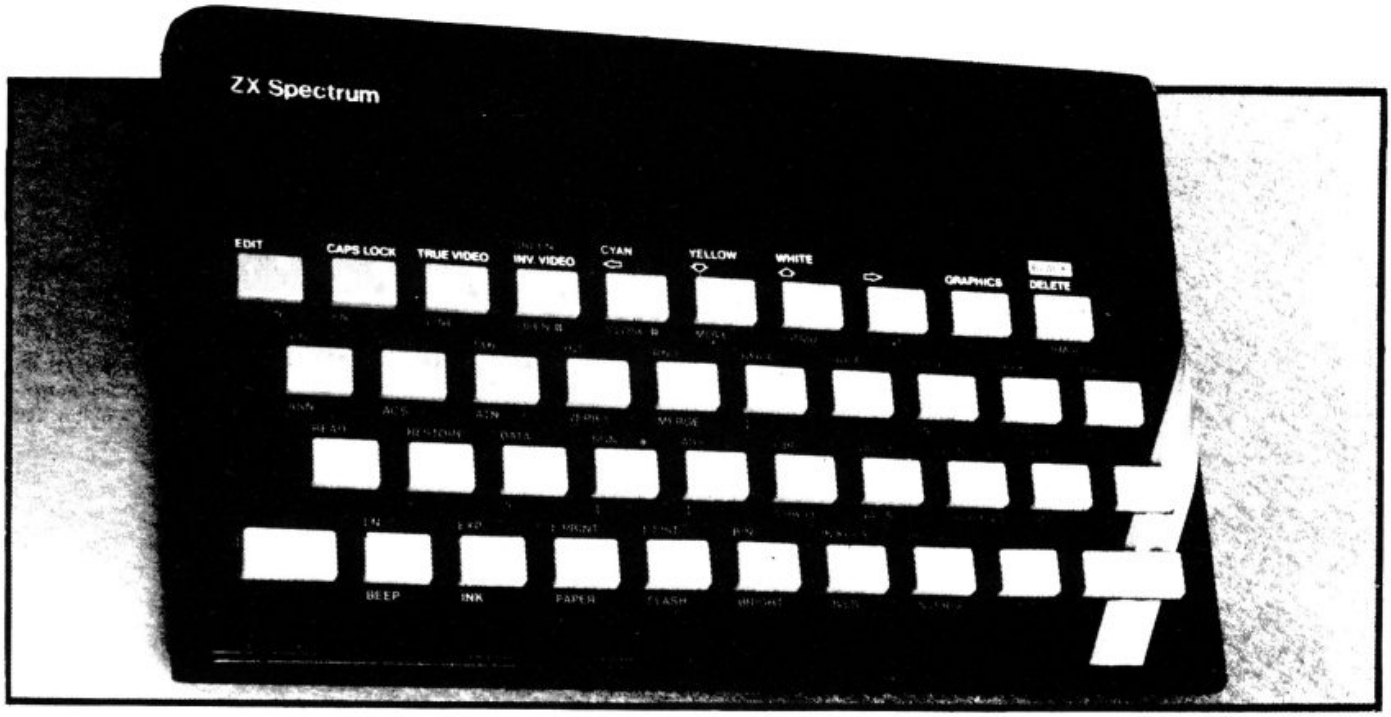
**Sound**
Internal loudspeaker can be operated over more than 10 octaves (actually 130 semitones) via basic BEEP command. Jack sockets at the rear of computer allow connections to external amplifier/speaker.

**Graphics**
Point, line, circle and arc drawing commands in high-resolution graphics.
16 pre-defined graphics characters plus 21 user-definable graphics characters. Also functions to yield character at a given position, attribute at a given position (colours, brightness and flash) and whether a given pixel is set. Text may be written on the screen on 24 lines of 32 characters. Text and graphics may be freely mixed.

**Colours**
Foreground and background colours, brightness and flashing are set by BASIC INK, PAPER, BRIGHT and FLASH commands. OVER may also be set, which performs an exclusive — or operation to overwrite any printing or plotting that is already on the screen. INVERSE will give inverse video printing. These six commands may be set globally to cover all further PRINT, PLOT, DRAW or CIRCLE commands, or locally within these commands to cover only the results of that command. They may also be set locally to cover text printed by an INPUT statement. Colour-control codes, which may be accessed from the keyboard, may be inserted into text or program listing, and when displayed will override the globally set colours until another control code is encountered. Brightness and flashing codes may be inserted into program or text, similarly. Colour-control codes in a program listing have no effect on its execution. Border colour is set by a BORDER command. The eight colours available are black, blue, red, magneta, green, cyan, yellow and white. All eight colours may be present on the screen at once, with some areas flashing and others steady, and any area may be highlighted extra bright.

**Screen**
The screen is divided into two sections. The top section — normally the first 22 lines — displays the program listing or the results of program or command execution. The bottom section — normally the last 2 lines — shows the command or program line currently being entered, or the program line currently being edited. It also shows the report messages. Full editing facilities of cursor left, cursor right, insert and delete (with auto-repeat facility) are available over this line. The bottom section will expand to accept a current line of up to 22 lines.

# SPECIFICATIONS



### Mathematical Operations And Functions

Arithmetic operations of +, −, ×, ÷, and raise to a power. Mathematical functions of sine, cosine, tangent and their inverses; natural logs and exponentials; sign function, absolute value function, and integer function; square root function, random number generation, and pi.
Numbers are stored as five bytes of floating point binary — giving a range of $+3 \times 10^{-39}$ to $+7 \times 10^{38}$ accurate to 9½ decimal digits. Binary numbers may be entered directly with the BIN function. =, >, <, >=, <= and <> may be used to compare string or arithmetic values or variables to yield 0 (false) or 1 (true). Logical operators AND, OR and NOT yield boolean results but will accept 0 (false) and any number (true).
User-definable functions are defined using DEF FN, and called using FN. They may take up to 26 numeric and 26 string arguments, and may yield string or numeric results.
There is a full DATA mechanism, using the commands READ, DATA and RESTORE.
A real-time clock is obtainable.

### String Operations And Functions

Strings can be concatenated with +. String variables or values may be compared with =, >, <, >=, <=, <> to give boolean results. String functions are VAL, VAL$, STR$ and LEN. CHR$ and CODE convert numbers to characters and vice versa, using the ASCII code. A string slicing mechanism exists, using the form a$ (x TO y).

### Variable Names

Numeric — any string starting with a letter (upper and lower case are not distinguished between, and spaces are ignored).
String — A$ to Z$.
FOR-NEXT loops — A-Z.
Numeric arrays — A-Z.
String arrays — A$ to Z$.
Simple variables and arrays with the same name are allowed and distinguished between.

### Arrays

Arrays may be multi-dimensional, with subscripts starting at 1. String arrays, technically character arrays, may have their last subscript omitted, yielding a string.

### Expression Evaluator

A full expression evaluator is called during program execution whenever an expression, constant or variable is encountered. This allows the use of expressions as arguments to GOTO, GOSUB, etc.
It also operates on commands allowing the ZX Spectrum to operate as a calculator.

### Cassette Interface

A tone leader is recorded before the information to overcome the automatic recording level fluctuations of some tape recorders, and a Schmitt trigger is used to remove noise on playback.
All saved information is started with a header containing information as to its type, title, length and address information. Program, screens, blocks of memory, string and character arrays may all be saved separately.
Programs, blocks of memory and arrays may be verified after saving.
Programs and arrays may be merged from tape to combine them with the existing contents of memory. Where two line numbers or variables names coincide, the old one is overwritten.
Programs may be saved with a line number, where execution will start immediately on loading.
The cassette interface runs at 1500 baud, through two 3.5 mm jack plugs.

### Expansion Port

This has the full data, address and control busses from the Z80A, and is used to interface to the ZX Printer, the RS232 and NET interfaces and the ZX Microdrives. IN and OUT commands give the I/O port equivalents of PEEK and POKE.

### ZX81 Compatibility

ZX81 BASIC is essentially a subset of ZX Spectrum BASIC. The differences are as follows.
FAST and SLOW: the ZX Spectrum operates at the speed of the ZX81 in FAST mode with the steady display of SLOW mode, and does not include these commands.
SCROLL: the ZX Spectrum scrolls automatically, asking the operator "scroll?" every time a screen is filled.
UNPLOT: the ZX Spectrum can unplot a pixel using PLOT OVER, and thus achieves unplot.
Character set: the ZX Spectrum uses the ASCII character set, as opposed to the ZX81 non-standard set.

**ZX OWNERS. Make Money with your ZX81 or Spectrum.** We are leading suppliers of software to Sinclair, with a superb range of games cassettes for the ZX81 and Spectrum. We require part-time agents in all areas to find and service retail outlets for our products. Car owners, over 18, with telephone, write for details to: M. Meek, Mikro-Gen, 24 Agar Crescent, Bracknell, Berks.

## BUTTERCRAFT SOFTWARE

**14 Western Avenue, Riddlesden Keighley, Yorks. ENGLAND**

### SPECTRUM AUTO-SONICS

Add superb sound-effects simply and easily straight into **your** programmes! 26 pre-set effects . . . space sounds, rayguns, raindrops . . . animals . . . engines . . .

Use them exactly as they come or use the graphic control panel to bend and twist and shape them into thousands of **your** unique sound-designs. THEN pop them permanently and independently into **your** BASIC programme to be reproduced again and again on command. It's childs-play!

Cassette/Instructions only **£4.99**

**UNISONIC AMPLIFIER/FM RADIO**

Use cassette lead to connect to Spectrum EAR socket for loud, clear amplification of computer output. *UNPLUG lead, and it's a neat pocket-radio with smart wrist strap. Uses one PP3 battery (not supplied).

Only **£4.99** post free

**FAST ARCADE-STYLE M/C GAMES**

WINGED AVENGERS (Laser shield/mother ship/Smart bombs. High Score. "One of the best Sinclair Games yet." Y.C.) **£4.50**

SPECTRUM SCRAMBLE — 8-directions, missiles, fuel dumps, meteors, etc. Hi-res colour + sound **£4.50**

**14 WESTERN AVENUE, RIDDLESDEN (2) KEIGHLEY, YORKS.**

## FOOTBALL POOLS PROGRAM

- Lists out, in order of preference, the 16 most likely score draws; also the 16 most likely homes, draws and aways.
- Picks out the results on the bookmakers' FIXED ODDS coupons that have been given over-generous odds. Calculates your expected profit!
- Allows the user to update the tables week by week as the results come in.

**This program is available on the ZX81 (16K) and ZX SPECTRUM (48K only)**

For a copy of the program on a quality cassette, plus an information leaflet giving a brief explanation of the theory send £5.95 to:

**HARTLAND SOFTWARE**
**(DEPT. Z), 8 PENZANCE PLACE, LONDON W11 4PA.**

**RING BRIDGETTE ON 01-437 1002 FOR YOUR CLASSIFIED AD.**
