Can you imagine 4D arrays? We show you how

British v American

British naval forces are pitted against the US marines in an innovative strategy game, ATRAM, which could be set to start a new trend in computer-moderated board games.

ATRAM (Advanced Tactical Reconnaissance and Attack Mission) is a tactical board game in which you, as force commander, must position your land-based forces and subsequently direct your airborne and naval forces against your opponent's strategic and tactical targets, while simultaneously defending your own.

The role of the computer is to record each manoeuvre and act as an impartial referee. The Spectrum replaces the cribbage-type method of scoring which would normally be employed.

Miles Bozeat, creator of ATRAM, is a designer and family man. He has a daughter and two sons and he thought up the game with the intention that

Anyone for graphics?

Compunet users should stay glued to their sets to look out for a competition which will enable them to show off their skill in graphics design.

Compunet Teleservices Ltd is offering a Commodore 1791 monitor as first prize to the entrant who designs the most original frame to introduce one of their services. It can be for one of the services already available or one planned for the future.

The monitor is worth over £200 and gives much higher resolution than a normal TV screen. There is also a second prize of £25, as well as £5 for anyone whose frame design is used to introduce a service.

You can also participate in a Christmas card competition; the winning entry will be used as the official Compunet Christmas card and will win £25. Other entries which catch the judges' attention will be

Leisure software

Mirrorsoft is moving into the home/leisure area with its new Home Discovery Series. Five new products are released for BBC, Electron, Commodore 64 and Spectrum.

The Joffe Plan is a no-diet system which should help you control your weight. Prof Justin Joffe has written a booklet which accompanies the package.

Know your own Personality is adapted from the book by Prof Eysenck and Dr Glenn Wilson. Are you extroverted or introverted? How emotionally stable are you? Are you tough or tenderminded? These are all areas covered by the 200 questions.

Know your own Psi-q assesses your psychic ability with a series of tests and games. Master Mind and Quizmaster follow the format of the BBC Mastermind TV series, while Star Seeker and Solar System will teach you about astronomy.

Prices are £9.95 for cassette and £12.95 for disc.

Mirrorsoft, Holborn Circus, London EC1P 1DQ

Lower prices

J Morrison (Micros) has announced that all its games will now cost £3.95, while utilities will retail at £7.95, with the exception of Zip (£3.95).

New titles include Lasergates, Skyjoust and Starfighter for the Dragon: Jellybones and Nightflight for the Commodore, and The Old House, Knight Errant, Haunted House and Scramble for the Sharp. Commodore utilities include Edasm, BasicPlus, Spritemaster and Zip.

J Morrison (Micros), 4 Rein Gdns, Tingley, W Yorks WF3 1JR

Spectrum launch

Activision has launched eight cassettes on the Spectrum. They are Beamrider, Enduro, HERO, Pitfall II, River Raid, Space Shuttle, Zenji and The Designer's Pencil.

Each will cost £7.99, with the exception of Pitfall II (£8.99) and The Designer's Pencil (£9.99).

"Spectrum owners will be pleasantly surprised at the sophistication and long-term entertainment value to be had from our first Sinclair titles;' said Geoff Heath, Activision's UK managing director.

The Designer's Pencil is a programmable pencil which operates by joystick, and virtually eliminates computer control and complex programming design.

Activision, c/o Ray Hodges Assocs, 5/7 Forlease Rd, Maidenhead, Berks SL6 1RP

Polish up your English

Polish up your English with Micro English: 'O' level English Language on your computer.

New from Ludinski Computer-assisted Learning, Micro English could help you revise or study on your own, and consists of 24 easy to use programs on disc or cassette for BBC/Electron.

At £24.50, the pack consists of two discs, or program, plus audio cassette. The audio cassette is intended to help you communicate verbally and in written form with your tutor, the computor.

More than 580 questions are featured and can be answered as multiple choice or normal questions.

LCL, 26 Avondale Ave, Staines, Middx

Speed and skill

A staggering total of 8,192 screen locations is claimed by Taskset for its new release, Cadcam Warrior. Scheduled for launch in mid November, the game will cost £9.95 on cassette and £12.95 on disc.

Pre-launch promises include "intricate detail... long lasting interest... extremely high quality." What you have to do is find your way to Cadcam Control and your rate of progress depends not only on your ability to destroy your opponents and clear all obstacles, but also your speed. Each game is claimed to be slightly different from any other.

Taskset, 13 High St, Bridlington YO16 4PR

We have lift-off!

First prize in a nationwide competition for schools is a five-day trip to the United States for a team of three students and their teacher. Highlight of the trip will be the chance to witness a scheduled shuttle launch from the J.F. Kennedy space centre in Florida, Miami. Also on the agenda is a visit to the EPCOT city of the future in Orlando.

The competition, The CUB British Schools Computer Challenge, is being sponsored by Microvitec. It's aimed at secondary schools and the Rt. Hon. Kenneth Baker MP has expressed his support. "A challenge for schools of this kind will undoubtedly help build upon the considerable enthusiasm for the use of computers in education which has developed over the last few years," he said.

Microvitec managing director Tony Martinez said: "We feel our success, coming only four years after the company's formation, is due in no small measure to our performance in the educational sector of the computer market in which 92 per cent of all schools are equipped with our CUB colour monitors. The competition is our way of acknowledging such support."

Mr Martinez went on to talk of a challenge between British and American schools, possibly in 1986. Upper age limit for the competition is 16 and entry forms will be distributed shortly before the preliminary rounds begin in November.

Microvitec, Futures Way, Bolling Rd, Bradford BD4 7TU

Adventures from books

The Nomad of Time, The Saga of Erik the Viking and The Stainless Steel Rat Saves the World are the titles of three new adventures from Mosaic Publishing.

Adapted from books, the games feature striking inlay cards which look more like book covers than software inlays.

The Saga of Erik the Viking runs on the Spectrum, BBC and Commodore and costs £9.95 for a boxed pack with booklet and cassette. Based on the book by Terry Jones, of Monty Python fame, it has over 200 locations, each illustrated. The game was written by Level 9 Computing.

The Nomad of Time is based on Michael Moorcock's Oswald Bastable series and runs on the Commodore. Price: £9.95.

The Stainless Steel Rat was written by Shards Software, as was the Nomads of Time, and runs on the Commodore. Your mission is to travel through time to save the world.

Mosaic Publishing, 187 Upper St, Islington, London N1 1RQ
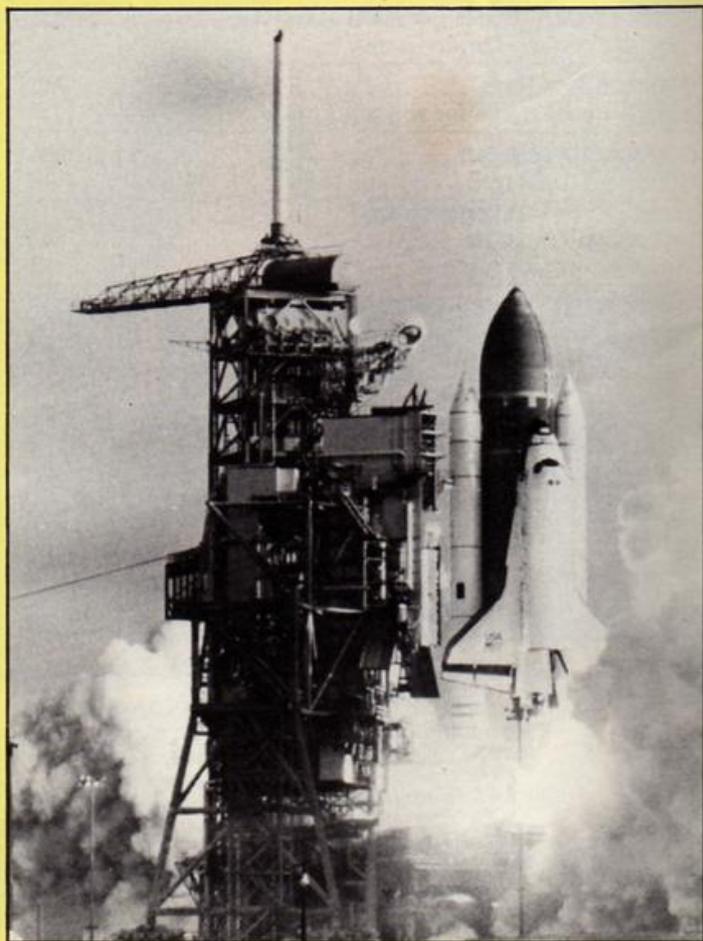

We have lift-off!

Graphics

From front page

used to stock up the Christmas card shop.

Jane Fairbank of Compunet, one of the judges, said: "The new system is graphically very exciting. We have the whole set of Commodore graphics to use." She added: "The idea came from the Compunet Jungle. That is the area where anyone can upload." She said that the standard was very high indeed.

Sue Neville of Compunet said: "Compunet is always looking for new designers and any frames used on the system will be paid for."

Jane Fairbank said that Compunet also plans other competitions for the future but details of these have not yet been finalised. She said: "The system is terrifically interactive so the idea for a competition was fairly obvious."

Closing date for all entries is December 14th. The competition is open to anyone who owns or who has access to the system and is not just for computer buffs. "We're looking for good, original images, some of which may be quite abstract." said one of the judges.

Compunet Teleservices Ltd, Metford Hse, 15/18 Clipstone St, London W1P 5ES

British

From front page

it should be played between lunch and tea-time on a Sunday. The game can be saved to tape and the board packed away, so that play can be resumed at a later time.

Mr Bozeat said: "The purest form of design is airplanes. I'm a military aircraft enthusiast — I'm not a warmonger but I love going to air shows. The Harrier is the most remarkable aircraft there has ever been. It's so elegant, I wish I'd designed it."

He continued: "I don't feel like a software author. To me, the computer is a tool." Mr Bozeat thought up the game before the home computer had become popular, and originally the scoring was by peg and hole cribbage board. Then, in 1983 the family bought a Spectrum and realised that there was an alternative to laborious scoring.

Miles Bozeat realised that his game now had commercial potential and Tony Morris was asked to write the program to accompany the game. ATRAM is professionally packaged and

marketed and Websters has agreed to act as distributors.

Said Mr Bozeat: "When using the computer as a database advising options, computing results and updating status, the machine is at its best, a reliable, very capable and friendly tool assisting imaginative and inventive competitors to pit their wits, plan their strategies and steel their nerve as they try to overwhelm the opposition."

Miles Bozeat also believes that with ATRAM the piracy problem has been licked, since the program is useless without the board and pieces.

AMSTRAD (£19.95) is being converted for the Commodore 64, and will be launched in the United States. American and British forces both have Harriers, and that's the reason why allied countries are battling it out — not that Mr Bozeat knows something that we don't! "It's no accident that the game is a competition between British and Americans." said Mr Bozeat. "There's nothing like a bit of friendly rivalry!"

Websters, Curzon Hse, Middleton Est, Guildford, Surrey GU2 5XW

Making music

Commodore is releasing its music package, Music Maker, which will enable you to use your micro as a musical instrument.

Included in the price — £29.95 — is software, a songbook and tutorial material, as well as a 24-key piano style keyboard to fit over your computer keyboard.

Eight built-in voices simulate guitar, piano and synthesiser and different modes can be selected. You can create a range of rhythms, from waltz to disco, and play three-note chords.

Single step input means that notes can be input using either notes or letters.

Commodore, 1 Hunters Way, Weldon, Corby, Northants NN17 1QX

Fuller revived by Nordic

Nordic Keyboards, the company which took over Fuller Micro Systems after it went into liquidation, has announced the launch of the FDS Executive, a replacement keyboard for the Spectrum. The keyboard will be officially launched at ECC Micromarket at Wembley.

Fuller — under new management

John Gray, joint managing director of Nordic, said: "We believe it's a winner. It's technically sound and reasonably priced at £59.95. Far from being a re-vamped design, the Executive allows the user to plug the Spectrum straight into the keyboard without having to unscrew the Spectrum case."

Nordic is reported to be spending thousands of pounds in the promotion of the Executive and new packaging and clearer instructions are

essential features.

Mr Gray stressed: "Although we have acquired the Fuller trademark because we didn't want to lose the identity, we would stress that we didn't take on the delivery and service problems which the old company had. We are building stocks of all the products and can deliver in three days."

Nordic Keyboards, Unit 13, Randals Rd, Knowsley Ind Est, Prescott, Merseyside

Quest for the holy grail

Melbourne House's latest release is Sir Lancelot, "a stunning new arcade game for the 16K Spectrum." according to pre-release publicity.

You are Sir Lancelot on the quest for the holy grail. Perils you encounter include birds and dogs, as well as offbeat figures like Pacman, bouncing balls and a cooking pot with legs.

Once you get to the castle you must collect all the items in each of 24 rooms before moving on to reach the treasure.

You have four life restorers to help you. At £5.95, Sir Lancelot will of course run on both 16K and 48K Spectrums.

Melbourne House, Castle Yard Hse, Richmond, Surrey

Wacky games

Micromega has now launched two new releases — Jasper and Jin Genie.

Jasper, at £6.95 for the Spectrum, is a "cartoon-style arcade adventure" with 22 screens. Collect objects for use later on. The story depicts Jasper the rat making his way through the jungle — and Micromega assures us it's wacky.

Micromega warns that clever planning, quick thinking and accurate control are your key to success, rather than sheer reaction speed.

Jinn Genie, for the Commodore 64 at £8.95, is a four-phase game set in Arabia. You must free the Golden City from Ifreet the Genie. Said Neil Hooper, general manager of Micromega: "Having firmly established ourselves in the Spectrum market, it's our intention now to provide Commodore owners with games of equal quality.

He went on: "We have been looking for the right game for a while, and Jinn Genie is definitely the one. We also hope to produce more for the Commodore in the near future — including some possible conversions of our Spectrum successes."

Micromega, Personal Systems and Software, 230-236 Lavender Hill, London SW11 1LE

Space hazards

Mastertronic has announced the release of four new games: two are conversions of Commodore 64 games to the Spectrum.

Starace, a new game for the Commodore, has you in charge of a space fighter ship battling through four galaxies to find the planet which will be your new home. Aliens, asteroids and fireballs are a few of the hazards in your way.

Challenger, new for the BBC, features you as destroyer of aliens and quads. Be careful that you don't run out of fuel.

Space Walk and BNX Racers

have now been converted for the Spectrum, and Mastertronic states that improvements and refinements have been made.

Mastertronic, Park Lorne, 111 Park Rd, London NW8 7JL

The road to Galilee

Shards Software has been looking to the Bible for inspiration for one of its Christmas titles: Galilee, for the Spectrum. This text adventure with graphics is set in the heart of the countryside around the Sea of Galilee in the first century. Written by the Rev. Peter Goodlad, author of Jericho Road, the game has been thoroughly researched. Price: £5.75.

Also from Shards: Empire, now on the Commodore 64 (£6.95). The COM empire is your foe, and you must strive to destroy its forces before it conquers the world. You are on the defensive: your enemy is both ruthless and aggressive, but you can save the day if you make full use of cunning and tactics. You begin with an equal number of territories and the fight is played out on a map of the world, with six scrolling continent maps and eight levels of difficulty.

The Pettigrew Chronicles have also been released by Shards for the Commodore and Spectrum, at £9.95. This is an "epic four-part adventure, designed to appeal to the whole family," according to Shards.

Shards, Ste G, Roycraft Hse, 15 Linton Rd, Barking, Essex

No more clutter!

Compudesk is the name of a new workstation which comes to you ready for assembly. Your keyboard sits on glide

runners and you can slide it away once you've finished using it. There's enough room to store up to 200 discs, while optional doors provide extra security.

The Compudesk stands 1269 mm high, and is 915 by 500 mm. You can choose either teak or rosewood finish. The Compudesk ranges in price from £58.99 to £75.99 depending on additional extras, but post and package costs are extra.

Jagger, Forge Lane, Canal Rd, Leeds LS12 2PS

Service with a smile?

Chalksoft now provides various services as well as educational software. You can swop a Chalksoft cassette in a part-exchange for a disc, if you return it in its original packaging with a cheque for £5.

Chalksoft also guarantees replacement of faulty software free of charge, if returned within 28 days together with your proof of purchase. After the 28 days have elapsed, Chalksoft will replace your defective program at a cost of £5.

Sampler discs are now available for teachers' use; each disc contains partial review copies of 10 or more programs, and costs £5, and Chalksoft has also published its accessories catalogue.

Chalksoft, 37 Willowslea Rd, Worcester WR3 7QP

Pint-sized vacuum cleaner

Here's a novel idea: a vacuum cleaner for your computer — the Minivac. This miniature cleaner runs on a nine-volt

Hand-sized Mini-vac from O & S Photographic

battery or 240-volt adaptor and "uses true vacuum cleaner action to remove minute particles and collect them in a cloth bag, unlike compressed air blowers which simply blow the pollutants into the air", according to O & S Photographic.

Two lens-quality fine brush vacuum heads and a vacuum bag are supplied with the

cleaner, and you can use a separate attachment to convert it to a blower.

Not only is it useful for removing dust on your keyboard and monitor screen, it can also come in handy when removing carbon dust and paper created during printing.

O & S Photographic, South Block, The Maltings, Sawbridgeworth, Herts

Low cost plotter/printer

Due for November release by Datafax: the Sakata SCP-800 colour plotter/printer, which is capable of handling A4 paper as well as a 210 mm paper roll. The printer/plotter costs approximately £206 and is compatible with most home computers — BBC, Spectrum, QL, Electron, Commodore 64, VIC-20 and Oric.

The SCP-800 is supplied together with a manual, and has the facility to supply screen dumps on Spectrum or BBC. Datafax was appointed as a Sakata distributor in September, and this is the first new product to be released since then. Datafax claims that the plotter/printer is of high quality and offers you tremendous versatility for graphics and listings.

Datafax, Datafax Hse, Bounty Rd, Basingstoke, Hants RG21 3BZ

Scramble for your Amstrad

Kuma has announced the release of its sixth title in its Amstrad range: Star Avengers. The game is a Scramble-type

arcade game which features 10 scenarios. You're in charge on each level. You have the choice of five stages of difficulty, but be warned — they start at difficult and progress to virtually impossible!

Jon Day, Kuma sales manager, said: "We're delighted with this version. It's a challenging high speed game and makes excellent use of the Amstrad's graphics and sound capabilities. Star Avengers is a sure winner and we are confident that it will rapidly become the number one game on the Amstrad."

Star Avengers costs £6.95.

Kuma, 12 Horseshoe Park, Pangbourne RG8 7JW

Late news

Henry's House, Soldier of Fortune and Witchswitch are three new releases from English Software. All for the Commodore 64, this trio feature Pavloda Fast-Load. Henry's House has a royal flavour and involves little Henry romping through his new abode. Price: £8.95. Soldier of Fortune is an arcade adventure (£7.95) while Witchswitch (£8.95) is a race against time to save a village from destruction by molten lava.

English Software, Box 43, Manchester M60 3AD

Jagger's Compudesk workstation

Over 100 copies of Kokotoni Wilf by

elite

to be won

If you own a Spectrum or Commodore 64 then you can enter our free competition. You could win a personalised copy of Elite's best-seller — Kokotoni Wilf

This week's competition is based on the best-selling game Kokotoni Wilf by Elite Systems.

Kokotoni Wilf is the first release from Elite Systems and is currently doing very well in the software charts. Elite has already planned its second and third titles which will be

games based upon two popular TV series: The Fall Guy and The Dukes of Hazzard.

Kokotoni Wilf is available for the Spectrum 48K and the Commodore 64 so our competition is open to most computer owners. The hero of the adventure is Kokotoni Wilf and his mission is to seek the lost fragments of the legendary Dragon Amulet. The pieces are strewn throughout time and with the help of the great magician Ulrich, Wilf is able to pass from one time zone to another to carry out his quest.

Wilf starts his adventure in the dangerous era of dinosaurs, millions of years before man walked the earth. When he has collected the parts of the amulet which are to be found in this age, Ulrich the old magician opens a glowing portal in time, and Wilf passes through to the next stage of his journey where the Vikings are terrorising the peoples of Europe. There are plenty of perils in the later time zones too, including such hostile adversaries as alien robots.

An added advantage that Wilf has over the average hero is that he is endowed with a pair of wings which gives him a much better chance against the many foes he has to face.

Kokotoni Wilf is a multiscreen arcade/adventure game with more than 60 screens, and Wilf can travel through six different time zones so there's plenty of variety. All the screens feature hi-resolution backgrounds.

The competition format is rather different this week from our usual wordsquare or spot the difference style. The idea of this is to get you involved in the game which is on offer.

The problem which you have to solve is mathematical but don't worry if maths isn't your strong point — we give you some helpful tips to nudge your thinking in the right direction.

So have a go and good luck.

The Competition

Kokotoni Wilf is standing on a hill and in the distance he can see a crossroad. At the centre of this crossroad lies a piece of the Dragon Amulet which Wilf must retrieve. There are four roads leading from the hill to the crossroads and Wilf must decide which is the best one to take so he can reach the fragment of the amulet in the shortest possible time.

Road A: This road is 2.7 km long but it is quite steep so Wilf can only travel at 5.9 km per hour.

Road B: This road is 2.9 km long but less steep so Wilf can travel at 6.2 km per hour.

Road C: This road is 3.7 km long but is easy going and Wilf can travel at 8 km per hour.

Road D: This is the shortest road and is only 1.4 km long but Wilf can only travel at 3 km per hour as it is over difficult terrain.

You must decide which route Wilf must take to recover the piece of the amulet as quickly as possible.

For those of you whose brains find mental arithmetic a particular strain, remember: speed divided by distance equals time.

How to enter

Study the problem carefully and when you have arrived at a solution fill in the entry coupon and seal it in an envelope. Remember to write on the back of the envelope which road you think Kokotoni Wilf should take.

Post your entry to Kokotoni Wilf Competition, Home Computing Weekly, No. 1, Golden Square, London W1R 3AB. Entries close at first post on Friday November 16, 1984.

You may enter as many times as you wish, but each entry must be on an official coupon — not a copy — and sealed in a separate envelope. **Important:** please follow carefully the guidelines on entering — incomplete coupons and entries without the solution on the back cannot be considered. If you are a winner, the coupon will be used as a label to send your prize so clear writing is essential.

The rules

Entries will not be accepted from employees of Argus Specialist Publications, Elite Systems and Alabaster Passmore & Sons. This restriction also applies to employees' families and agents of the companies.

The How to Enter section forms part of the rules.

Zenji
48K Spectrum
£7.99

Activision, 15 Harley Hse, Marylebone St, London NW1

Words do not easily spring to mind when trying to describe this game, for I have seen none like it before. It's a maze game, but what a maze game! You have to build the maze yourself.

Reading the enclosed leaflet, I got the impression that the idea stems from a philosophical approach to life. The player is advised to beware desires, and illusions. Further, the object is to make an unbroken path to the Source, learning lessons on the way, otherwise you lose your head, with only four incarnations in reserve.

The game starts with a choice of keyboard or joysticks, and a black mark for not being able to redefine the keyboard. Another black mark because the 'up' key is shown as 'Z'; a misprint, it should be '2'.

I have no idea how many variations there are, because I didn't get far, I always ran out of time.

Although it takes getting used to, I don't think you play this game, you experience it. It's worth adding to your collection if you like a game that makes you think. **B.B.**

★★★★★

The Dragonstar Trilogy
48K Spectrum
£4.95

Delta 4, The Sheiling, New Rd, Swanmore, Hants SO3 2PE

This is a three part all-text adventure written with the Quill. Set in the quasi-medieval Dungeons and Dragons era, the quest is three-fold.

First, find the princess held captive by a dragon, and rescue her by defeating him. She guides you to the Lake of Fire.

After loading the second part, you find yourself at its southern edge with a new quest; to find the Golden Key of Seven.

That done, a message is revealed which launches you on the final conquest of the Dark One, and the destruction of the Dragonstar Crystal.

I didn't feel tempted to sit for hours trying to unravel Dragonstar's secrets. Perhaps it's just me, but it doesn't match other adventures I've seen.

Presenting the user with a series of hurdles loosely linked by descriptions relies overwhelmingly on his desire to beat the programmer. For me this is not enough.

The best adventures should surround you in a land of fantasy, draw you with an intriguing plot, challenge you to defeat willy foes, whilst holding your attention by rewarding you with a little success, and perhaps wit. Very few do **D.M.**

The Final Mission
48K Spectrum
£5.50

Incentive, 54 London St, Reading RG1 4SQ

'Deep within Vran's Temple you set forth on the Final Mission... can you outwit the wandering slime, the five gate guardians, or even Vran himself?' I was reminded of these words, from the cassette inlay, when I was devoured by the slime after scoring 36% of this adventure.

The Final Mission is the last adventure in the Ket trilogy. I had not seen the previous ones, so I was quite keen to get stuck into this one and give a good account of myself.

The excellent, initial hi-res screen leads one to believe that this is going to be a graphic adventure with lots of pretty pictures, but this is not the case. In the 36% I saw, it was text only.

One excellent aspect of this tape, is that it features power load, so it's not long before you are playing the game. The usual adventure commands are present and interpretation of human input is good. It's very user friendly in its attempts to understand you and it poses some interesting problems.

I must work out how to defeat the slime... **M.B.**

Adventure assortment

A wide variety of adventure games to get your brain working. There's excitement and laughs in this batch

The Code
48K Spectrum
£8.95

Soft Concern, PO Box 65, Warwick CV34 4JY

Initially one is most impressed by the hi-resolution screen at the beginning of this adventure tape.

It's a picture of Bogey (Humphrey Bogart), complete with that and raincoat, and he is illuminated by a sort of art nouveau globe lampshade.

The hi-res screen was, for me, the most memorable moment in this text-only, spy-thriller based, adventure game.

Your objective is to penetrate a KCB stronghold and get into the code room to discover the secret code.

Having discovered the secret, you quickly write to Soft Concern Ltd, and if you are the first with the solution, you collect £2,500.

The adventure game itself is a competent rendering, but the lack of a cursor, for human input, I found most annoying. You would expect the high price tag of £8.95 to include a free cursor.

Perhaps the exorbitant price is to cover the cost of having the cassette inlay printed in Russian and to pay out the prize money with. **M.B.**

★★

The Quest for the Holy Joystick
48K Spectrum
£4.95

Delta 4, The Sheiling, New Rd, Swanmore, Hants SO3 2PE

A Quilled all-text adventure to make you laugh! And it works. Humour comes in many varieties; this is the wry, sly in-joke kind.

Via a very classy re-defined character set, you are transported to London, the Holy City. From there, a variety of buses and coaches take you all over the country to different well-known software houses.

There you meet not only the authors, often described in less than complimentary terms, but characters and situations from their programs. The latter prove very difficult to get out of.

Perhaps the most amusing thing about this program, to my perverse sense of humour, is the way in which the code transfers you in one fell swoop from Hampshire to America, or from the south coast to Spain! And why not?

There is one snag with 'in' humour. You have to be 'in' to appreciate it! As a result, a market is assured with the staff of Melbourne House, Automata and Dream, though north of Watford sales could be a little thin! If you're a software freak, and know the personalities involved, you'll enjoy this. **D.M.**

Five for the 64

Great games for your Commodore 64 which range from decorating your home to gun-fighting in the wild west

Ancipital
CBM 64
£7.50

Llamasoft, 49 Mount Pleasant, Tadley, Hants RG26 6BN

This is the latest outpouring of Jeff Minter — the man they all hate but love to copy. It follows on from the last two games and uses characters from both. Our hero is a half-man half-goat who travels through 100 rooms arranged in a ten by ten array. You are given a map with the game and the status lines on the playing screen give further help.

So what makes this game different? Initially there are no exits in any of the rooms. You must create them by zapping the weird inhabitants of the rooms. The rooms have an odd system of gravity enabling you to stand on any wall. Jumping from wall to wall is a challenge in itself.

You need different strategies for different rooms and must collect camels to progress. One nasty is Rory the guinea-pig. Shoot him at your peril.

Grapically the game is impeccable and the provision of "Help" for every room is a major advance. The soundtrack consists of jungle drums and adds to the excitement.

Buy it, you really can't afford to miss this beauty. **M.W.**

Ocean, Ocean Hse, 8 Central St, Manchester M2 5NS

This is a shoot-em-down game with a difference. You are the sheriff in a frontier town and judging by the number of villains it's a full time job.

The game uses Nova-load and you are serenaded by Gilbert & Sullivan's A Policeman's Lot giving you a foretaste of things to come. You are then thrown into the game, patrolling the main street, shooting the baddies before they rob the bank or run off with the saloon girls. They also try to shoot you.

The main street comprises of the sheriff's office and jail, saloon, bank, hotel and undertaker's, all nicely drawn. Whenever you kill a baddie, Rigor Mortis, the undertaker, dashes out and drags the body away. He seems immune to the effects of gunfire. If you are shot, he drags you away.

Should you survive the first wave, you have a shoot-out for bonus points. Subsequent levels have riders on horseback and men with dynamite.

In all, nicely executed with good graphics and sound effect. If you feel like emulating Gary Cooper, you can do a lot worse than buy this. **M.W.**

Bristles
CBM 64
£8.95

Statesoft, Bessemer Dr, Stevenage, Herts

This game involves the age old pastime of house-painting. Your objective is to read six hidden messages. You collect a word or group of words appearing at the end of each screen. Eight screens give the full sentence and there are six sentences, one for each skill level.

The options include: the choice of painter and skill level and number of joysticks. The choice of painter involves "Sex select". This only refers to the choice of a male or female name and a corresponding figure on the screen.

You guide your painter around the house painting each room as he passes through. There are ladders and lifts to help you to each floor. You must avoid getting squashed by the lift or knocked down by a flying paint can.

Each screen has more obstacles to frustrate you. The graphics are good. The sound track plays extracts from the Nutcracker Suite and is well executed. The sound effects can help, especially when the lights are out and you can't see the walls.

Overall, a nice game, which tended, unfortunately, to become boring. **M.W.**

Boulder Dash
CBM 64 £8.95

Statesoft, Bessemer Dr, Stevenage, Herts

This is a real winner from stateside and as such should carry health warnings since it is likely to keep you up all night and severely tax your blood pressure and patience.

You must guide Rockford underground searching for Jewels and avoiding falling rocks which have a habit of crushing him. If you collect enough jewels and find the exit, you progress to the next level.

It's not as easy as you think since it is easy to end up squashed or trapped. There are sixteen caves with five skill levels. You can start at any one of five caves. Each has different features and you must develop new tactics for each. Some screens behave differently each time. After four screens there is a playable intermission, but I can't comment on these since I haven't managed to reach one.

The graphics are first class and the animation and movement of rocks are positively Newtonian. This game surpasses all of its genre and is in a class of it's own. This is a must for your games collection. **M.W.**

Pilot-Plus/64
CBM 74 £29.95

John Wiley & Sons, Baffins La, Chichester, Sussex PO19 1UD

At last, new language packages are appearing for the 64. This package is a nice implementation of Pilot. Pilot is a language developed for computer assisted learning, and as such is of value to teachers and educationalists.

This package offers Pilot with a range of extensions for the use of the 64's sound and other features. Hi-resolution graphics are not directly available, but low resolution plotting is offered. Overall the package offers the features of BASIC plus a lot more. A good feature is the editor which includes bi-directional scrolling and many tool kit commands.

One bizarre aspect is that using two simple commands you can alternate between Pilot and BASIC, each editor supporting it's own language. Hence if you wish to enter a hybrid Pilot/BASIC program you must remember to switch to the right editor at the right time. A little confusing, but works well enough.

Overall, an excellent package giving a flexible and useful high-level language. This is enhanced by the ability to combine Pilot/BASIC/machine code. I can highly recommend it. **A.W.**

Hints and Tips

Slow down!

When listing a program on the Commodore 64 it is possible to slow down the flurry of letters and figures by pressing the CTRL key while the program is being listed.

This slows the listing rate down to a speed where it becomes possible to view the program more easily, and is especially useful when searching through long programs.

When writing a joystick program for the Commodore 64 it is possible to have keyboard control as well. This is achieved by using the joystick port one. Simply write the program as if just writing for a joystick.

The keys which work in place of the joystick (port one only) are as follows:

Joystick move	Key	Command
up	1	up
down	arrow key	down
right	2	right
left	CTRL	left
fire	space	fire

Andrew Clarke, Warwickshire

VIC piano keys

Typing in long programs can be a dreary business. So here's a short program to solve that problem and make typing a joy.

When this program is run the READY sign should appear after about two seconds. Now try pressing a few keys. Yes, the VIC is now a piano and the good thing is the program itself does not use up any of the 3.5K which you need for your own programs.

If you want to stop this program then press STOP + RESTORE, and to return type SYS672.

Endless lives

Here's a tip for those who are tired of having short games or who want high scores. It's for the BBC B's Planetoids by Acornsoft.

1 press break
2 type PAGE = &3C00 (return)
3 type LOAD "Planet1" (return)

When loaded

4 type line:150?&276B = &99
5 now RUN it and you have 99 lives!

R Evans, Edwinstowe, Notts

POKES on VIC-20

Here is a list of POKE commands which may be useful to VIC-20 users.
• SYS 64802 or SYS 64824 reset the computer
• POKE 650,128 makes all keys repeat
• This short routine knocks out the runstop and restore keys:
10   POKE 788,194: REM knocks out runstop key
20   POKE 792,91:POKE 793,255:REM knocks out restore key
• This routine prevents the program from being listed:
0 REM [shifted L]
• POKE 22,35 prevents program line numbers from listing
• POKE 802,0:POKE 803,0 prevents saving of program. Return to normal with POKE 802,243:POKE 803, 243
• POKE 9,x when x=0 to 21 positions cursor along a line
• You can also position the cursor with this routine
10 POKE 201,Y:REM Y = row number
20 POKE 202,X:REM X =

column number
• Control cursor speed by POKEing any number into 37879 (0 to 255)
• POKE 198,3:POKE 632, 147:POKE 633,131 is the same as LOAD
These routines should prove useful as they can easily be included in your own programs.

A Dunstall, Shoreham-by-Sea

Colourful Dragon

This program enables Dragon users to mix different colours on the hi-res screen. You input two colours and then the computer mixes them by drawing lines alternately in each colour. The EXEC command in line 110 waits till a key is pressed and then returns to start, mixing two different colours.

This is how it works:

10   clears screen
20   inputs number for first colour
30   inputs number for second colour
40   sets up hi-res screen
50   loop for number of lines
60   sets first colour
70   draws lines in first colour
80   sets second colour
90   draws lines one pixel in front of previous line
100 loop back for next line
110 waits for key depression, then GOTO start

This is the program:

```
10  CLS
20    INPUT  "FIRST
NUMBER":A
30    INPUT  "SECOND
NUMBER":B
40  PMODE3:SCREEN1,1:
PCLS
50    FORZ=0  TO  192
STEP2
60  COLOUR A
70    LINE  (0,Z)-(256,Z),
PSET
80  COLOUR B
90    LINE  (0,Z+1)-(256,
Z+1), PSET
100  NEXT Z
110  EXEC41194:GOTO10
```

Andrew J Garvey, Middx

Three colours on Atari

Did you know that the Atari can produce three different colours in graphics mode 0? Well, it can after you set up a display list involving ANTIC — that virtually unknown super graphics chip which is found in all English Ataris.

After the following code has been entered your screen will turn black and any characters on the screen will become messy splurges of colour. This is because each character has been divided in 4 x 8 matrix, rather than 8 x 8.

```
10  DL=PEEK(560)+PEEK
(561)*256+4
20  FOR I=2 TO 24:POKE
DL+I,4:NEXT I
```

By rearranging the formation of the pixels within each GR.4 pixel, the three default colours can be produced.

As there are only four possible pixel arrangements within each GR.4 pixel,

only the colour available in GR.7 can be produced. Using the appropriate SET COLOUR or POKE commands these colours can be changed accordingly.
James Harrison, Quorn, Leics

You could be on our pages

We welcome programs, articles and tips from our readers. If you feel that your work meets our standards, please submit it to us for consideration for publication.

● Programs must always be sent on cassette. Listings are helpful, but not necessary. Check carefully that they are bug-free. Include details of what your program does, how it works, variables you have used and hints on conversion.

● Articles on using home computers should be no longer than 2,000 words. Don't worry about your writing ability — just try to keep to the style in HCW. Articles most likely to be published will help our readers make better use of their micros by giving useful ideas, possibly with programming examples. We will convert any sketched illustrations into finished artwork.

● Tips are short articles, and brief programming routines. Your hints can aid other computer users.

All submissions will be acknowledged and the copyright in such works which will pass to Argus Specialist Publications Ltd will be paid for at competitive rates.
Keep a copy of your work and include an SAE. Label everything clearly and give a daytime and home phone number if you can.
All work for consideration should be sent to:

Paul Liptrot, Home Computing Weekly, No.1 Golden Square, London W1R 3AB

Noteworthy
TI-99/4A £7

Stainless, 10 Alstone Rd, Stockport, Cheshire

This is another of several programs I've reviewed that has been written by R Trueman. Like all the others, the graphics are superb and the game fun to play.

In this game a smiling little blue creature bounds along the screen. To score points he must eat notes that are found along several floors. He leaps up to each floor by jumping beneath large power blocks in the ceiling. When he reaches the top he exits to the next screen.

There are monsters to avoid. Using smaller blocks on the ceilings, he may jump over them. Further hazards include spikes that point down from the ceilings. At intervals these shoot down, then retract. Should your creature be under one a life is lost and he begins the ascent again, but not from screen one.

As each screen is completed the current score is shown. This is based on bonuses for the number of screens completed in addition to the number of notes eaten.

This needs Extended BASIC.

Computer
Kensington
32K BBC £12.95

Leisure Genius, 3 Montagu Row, London W1H 1AB

Those who already know how to play Kensington will know what a tactical challenge it is.

For those who've never heard of it, Kensington is played on a grid of triangles, squares and hexagons and involves placing your own coloured stones to form certain shapes.

A triangle allows you to move one of your opponents stones, which is very handy when a stone is in an offensive position. A square allows you to move two stones.

Your aim is to surround either: one of the two hexigons of your own stone colour, or one of the three neutral hexigons. The more alert player will be able to work out that there are seven hexigons overall.

Even if you are none the wiser as to how it's played I can tell you that it's an enthralling game.

Level one is usually beatable and is the perfect start for novices, level three is the hardest level and will give anyone a run for their money.

Playing the computer is fascinating and the game is astoundingly addictive. Leisure Genius have produced an extremely well presented and throughly enjoyable game. **M.B.**

★ ★ ★ ★ ★

Psytraxx
48K Spectrum
£6.95

The Edge, 31 Maiden La, Covent Gdn, London WC2

The first thing you notice when loading is that the program has a fast loading routine in it. This loads the program in less time than normal.

Claiming more than a thousand screens, the action takes place inside a computer. Now where have I seen that before?

You have to collect master key cards in order to gain access to a CPU, which is at the heart of every computer. There are, of course, adversaries, such as flying chips (IC's, transistors, and the like, stop me if you've heard it before. The action is fast and furious, and energy has to be replenished every now and again.

I haven't quite figured out the scoring system, maybe that's because I have only just discovered a firing key. The press release sheet gives all the controls, with joystick options on screen, but there is no mention of a key to fire a retaliatory blast.

In case you are expecting one thousand locations I had better add that they are variations of a maze, with PCB track representing the walls. Better than the average game in this class. **B.B.**

From Kensington to Ramagora

Here are a few games for every taste or preference. You can be a hero or a conqueror

Zorakk the
Conqueror
32K BBC £7.95

Icon, 65 High St, Gosforth, Tyne & Wear

The inlay looked very inviting, and the instructions seemed promising. You have to play the part of Zorakk, and you find the lost Crown of Ultimate Darkness, which lies in three pieces, one in each of the medieval lands of Ramagora.

On loading, the game display is sluggishly drawn. The main feature on screen is the graphical representation of the land you are in, which is split up into 30 squares in grid fashion. You move around using the keys N, S, E and W, and there are four buildings which you may visit. You may buy warriors, or you can enter a battle.

The latter is always welcome because you have to win a battle to stand a chance of obtaining a piece of the crown. Whether you win or not is totally random, progress can in no way be swayed by the player.

Hazards such as starvation, the plague and dragons don't improve life.

Overall it's not remarkable and will probably be favoured by the younger generation. The complete randomness often allows a novice to achieve a higher score than an experienced player. **M.B.**

H.E.R.O.
48K Spectrum
£7.99

Activision, 15 Harley Hse, Marylebone Rd, London NW1

Roderick Hero is a bit of a send up of some of those heroes in American comics. It appears that volcanic activity has trapped some miners in the mine shafts of Mount Leone. Just what they are mining isn't made clear, it probably isn't relevant to the game anyway.

Like other miner games I have seen, there are different hazards on different levels. Unlike the other games, you begin each level with six sticks of dynamite, and, of course, the ubiquitous micro laser beam.

Again as in other similar games, you have a power/energy guage which diminishes as you plumb the depths.

Apparently there are spiders, shaft bats, miner moths and nesting snakes, some of which I encountered on my travels.

The scoring is reasonably straightforward, with the highest marks, one thousand, scored when you rescue each miner. Of course you can't progress to a lower level if you haven't rescued the miner on your level.

It seems there is a special message if you score one million, Ye Gods! The graphics are nothing to write home about, although the movement is smooth. **B.B.**

Sweet Talker

Cheetah Marketing, 24 Ray St,
London EC1R 3DJ

This is one of the first of the allophone-based speech synthesisers available for the BBC and as such it has to compete directly with Acorn's own Speech Synthesis upgrade. As I have used both, I will compare one with the other as far as is necessary.

Both systems plug into an area of the BBC main board left free for such upgrades, but while the Acorn system needs to be fitted by a dealer, since there are several modifications to early boards and several components mounted on a small circuit board. This plugs directly into one of the empty sockets. This is such a simple operation that almost anyone could do it without risk of damage to the computer.

Usage of the two devices is very different. The Acorn upgrade uses the SOUND statement, so you might assume it will be the easier system to use. In fact this isn't so. The Acorn device is fine if you want to say any of the 185 words in its vocabulary, but if you want to build up your own words you have to do so by chopping those provided into small parts and then building your words up from these parts. Using the Cheetah Sweet Talker makes all this effort completely unnecessary because of the allophone system.

The theory behind allophones is that all English speech can be broken down into less than 60 component speech parts. Once you have all these parts in a device, and a list to choose from, you should be able to create any word in the English language. You must first decide which sounds make up a word and then put those sounds together. This is done using a very short machine code program and a DATA statement; and the demonstration program supplied shows how easy it is.

The difference between the two systems is amazing. I never dared to try and make new words for the Acorn system but within two minutes I was creating speech from this one. The drawback is the quality of speech: Acorn's really does sound human whereas Cheetah's is very machine-like — so much so that my son refers to it as Robot Speech

Here is the crunch: you can have good quality but a very limited vocabulary or an unlimited vocabulary with poorer quality speech. I will settle for the Cheetah everytime. We all know that it's a machine so why not admit it and use the system to the full.

The most disappointing feature of the whole system is the manual, which is nothing more than a single sheet of A4 paper. This could be much improved with more detailed information on the use of the pauses and a better fitting diagram. Having said that, it is adequate. I got going in a matter of minutes.

D.C.

Cheetah RAT

Cheetah Marketing, 24 Ray St,
London EC1R 3DJ

Imagine a remote control joystick which is able to perform all the functions of a normal joystick, without a cable connection to your Spectrum computer from a distance up to 12 feet from the screen. Put all that together and you have the Cheetah RAT. In case you are wondering, RAT stands for Remote Action Transmitter.

RAT works in much the same way as a remote TV controller. You point the transmitter hand unit in the approximate direction of the plug-in receiver module (both supplied) and a touch-sensitive pad on the hand unit sends your commands to the Spectrum. A simple one-page set of instructions completes the package.

I was disappointed with the quality of construction of the grey/blue hand unit. It requires a PP3 battery (not supplied) and when the battery is inserted and the hatch closed, my hand unit began to split along its seams. The touch pad in the unit I received was beginning to peal away from the rest of the unit.

By contrast, the plug-in module was sturdily built. It included an edge connector on the reverse side of the unit to allow other modules to be added if required.

The touch pad on the hand unit is divided into two parts. At the front is an orange coloured fire button, while close to the back is a blue clock-face with eight markings, indicating the eight directions of movement. This is designed for ease of use by left- and right-handed players. All you need to do (so Cheetah claims) is touch the marking on the clock to send your man in the appropriate direction. I found you had to press the N,S,W and E markings quite hard to obtain a response, and the markings for diagonal movement almost never worked, even when I pressed really hard.

While it would take an experienced joystick user some time to adjust to this new control method, RAT offers one big advantage. If you use a large screen TV as monitor, then you can move some distance away from the screen. I tested it at six feet, and it worked as well as it did at six inches. From 12 feet I couldn't see my screen too well, but it still seemed OK!

RAT can be used for any game designed for use with Kempston joysticks; this gives you a wide selection, but, of course, quite a few games won't work. You can also write your own programs to use RAT. Incorporate the BASIC line LET a = IN 31 in your program; a will have a value of 0 if no pad is touched, or a value up to 16 depending on which single pad is pressed. Similarly, in machine code, you would use In A,31.

RAT is an interesting and novel idea. If the touch pads had really been touch-sensitive, then the RAT's speed might well have been faster than a conventional joystick, as claimed by the manufacturer. Perhaps full production versions may offer better sensitivity, and a hand unit which does not fall apart! **D.N.**

The RAT — Cheetah's remote action transmitter

Cheetah Sweet Talker

Three in a row

Variety is the spice of life, and there is plenty of variety with these three programs from Paul Sansom and Paul Newsham. The choice is yours — you can either attack martians, go diving, or just eat eggs and avoid walls

Although you spend most of your time eating eggs in the first game, its actual name is The Walls.

If you have ever fancied going on a totally egg-orientated diet, then this is the game for you, because you walk around the screen eating as many eggs as possible.

However, danger is always around in the form of forks and closing walls, which you have to avoid. All is not lost, however, so don't despair. There is a way to escape a gory death — by getting a key and going through the exit.

Variables

lv lives left
h and g time for walls
sr screen you are on
sc score
mp man's position
mc man's colour
aa and bb exit position
ab and ba exit colour
p1, p2, p3, and p4 wall's position

For each egg you eat you will get 10 points, when you retrieve the key you will be awarded 50 points, and if you actually manage to get through the exit — 100 points is awaiting you.

Quick reactions and a keen eye are required for this game, so good luck and get eating.

How it works

7-8 initialises variables and protects graphics
10-41 data for graphics
50-89 set up screen
90-130 movement
135-190 main routine
200-230 end of game
250-255 sound for new screen
300-480 instructions

From walls to water, with a two-part program called Diver. You play the part of Neil the diver, and your aim is to dive the watery depths to claim the gold coins.

This may sound easy, but there are problems. For instance, your tanks only hold a limited amount of oxygen — if and when this runs out, you lose one of your three lives.

When you pick up a gold coin you get 50 points, and you also get a further 50 points plus a bonus for the oxygen left, when you put a coin in your boat at the top of the screen.

Man-eating sharks are another problem to contend with. You can shoot these sharks with your trusty harpoon — but this is not advisable for long periods because your oxygen runs out fast.

Variables
dp diver position
dc diver colour
li lives left
d   diver's direction
ox oxygen remaining
sc score

If you prefer Martian blasting to shark shooting, then Martian Attack — another two-part programme — is right up your galaxy.

In this game you are in control of a 'MXSP' fighter plane, and you must fly through the city shooting the alien attack waves one-by-one. As you do so, the occasional tractor beam bars your way, and you must shoot one of the photon zappers at either end to destroy it.

If you fail to destroy the zappers, you will be destroyed by the beam.

Things to watch-out for include air mines — they imitate sycrons, but if shot they destroy you. Also, if you fly into an air mine, you will disintegrate.

One point to make about this game is that it only just fits into the unexpanded VIC-20, so do not insert any unrequired spaces

for the machine will say memory error and you might lose the program.

Variables
li lives left
sc score
pp ships position
pc ships colour
q how far you have travelled on that sheet

How it works
5 variables
10-20 set up double size characters
30-40 game set-up
55-70 movement of ship and check for fire
75-200 main routine
5000-750 fire routine
800-870 end of game routine
900-1190 instructions

Common to all of these games is that they are over 88 characters long and will have to be abbreviated. The abbreviations are on page 133 and 134 of the user's manual.

Can you imagine 4D arrays? We show you how

Four-dimensional arrays are hard to visualise. Graham Kendall explains the logic behind the fourth, fifth and even sixth dimension. Even novices should catch on

Recently some colleagues and I were discussing arrays, and how many dimensions you could actually DIM. We started to put all sorts of shapes and figures on a whiteboard in an attempt to represent how the computer actually sees the array. We didn't find much trouble with a single variable or with a one-dimensional array, but when it came to a four-dimensional array we ran into problems. Other 'experts' put their heads round the door, saying "What're you doing? Drawing four dimensional arrays — that's easy. Give me the pen". Quarter of an hour later they would look at their handiwork, hand the pen over to somebody else and walk out confused and baffled.

We reasoned that if you can't imagine a four-dimensional array, let alone draw one, how does a computer set one up and access it? What's more, how does it handle a five- or six-dimensional array?

This is how we've come to understand it. If we start off with a single variable A, and we type **A = 10** the computer will set up a box called A and inside this box it will store the number 10.

If instead we type **DIM A(3)** the computer sets up three locations (boxes; Fig.1 called A(1), A(2) and A(3) (assuming the computer starts numbering arrays from 1 and not 0). We can access these locations by typing **A(1) = 10** or by putting a variable inside the brackets, e.g. **A(I) = 10**.

If we dimensioned an array with **DIM A(3,3)** the computer sets up nine locations (Fig.2). In order to access any of these locations you must specify the row followed by the column. Thus, if you type A(2,3) it will access the second row and the third column (see asterix).

With three-dimensional arrays, if we type **DIM A(3,3,3)** this will set up 27 locations (3x3 x3). Imagine a box or a Rubic's cube with nine faces on each side; that's what we've just set up (Fig.3). To access this box

we must specify not only row and column but also depth. So if we type A(1,3,3) we are accessing the first row, third column and third depth (see asterix).

A three dimensional array is a way of accessing something in three different ways: firstly, left and right; secondly, up and down and thirdly, backwards and forwards. Left and right gives us the rows, up and down the columns and backwards and forwards the depth. This can be drawn (Fig.3).

But if you want to add another dimension to your drawing you can't — any line you draw will always be in one of the other dimensions. We are faced with the problem of imagining a four-dimensional array and subsequently, realising how the computer stores and accesses it.

Look at it this way. **DIM A(3,3,3,2)** sets up a four-dimensional array. In reality it sets up two three-dimensional arrays (Fig.4). The last parameter dictates how many three-dimensional arrays are to be set up, thus **DIM A(3,3,3,2)** sets up two three-dimensional arrays giving 54 possible locations (3x3x3x2) while **DIM A(3,3,3,7)** sets up seven three-dimensional arrays giving 189 possible locations (3x3x3x7).

In a four-dimensional array the first three parameters relate to row, column and depth, while the fourth parameter relates to which three-dimensional array you wish to access. So A(3,3,3,1) would access the asterix in Fig.4 whereas A(3,3,3,2) would access the percentage sign. A five-dimensional array **DIM A(3,3,3,3,3)** sets up 243 locations (3x3x3x3x3). Think of this as nine three-dimensional arrays (Fig.5). The computer accesses this by row, column, depth, sub-set and array within sub-set.

Thus if you type A(3,3,3,2,1) it accesses row 3, column 3, depth 3, sub-set 2, and array 1 within that sub-set. In this way A(3,3,3,2,1) would access the

Fig. 1 One-dimensional array
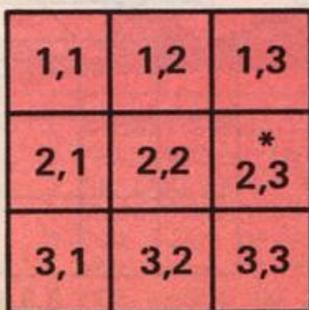

Fig. 2 Two-dimensional array
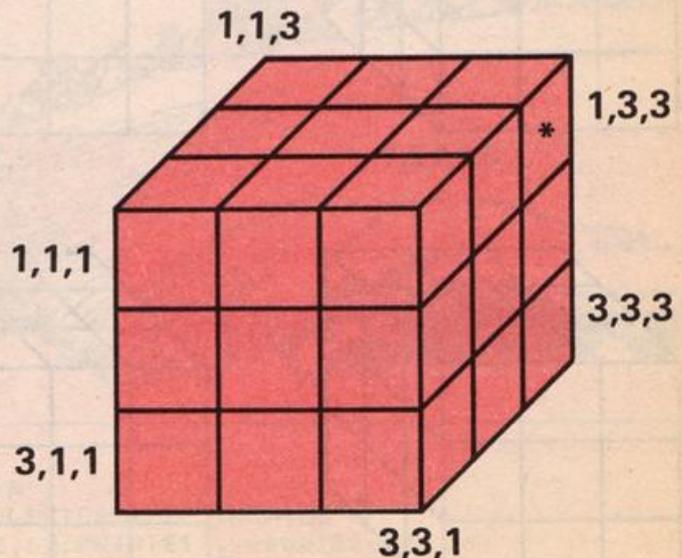

Fig. 3 Three-dimensional array

asterix in Fig.5, and **A(3,3,3,3, 2)** would access the percentage sign.

Now **DIM A(3,3,3,3,3)** gives us nine three-dimensional arrays, which means 243 possible locations (3x3x3x3x3), but if we **DIM A(3,3,3,9)** this also gives us nine three-dimensional arrays and thus 243 locations. If this is the case why do we need more than four-dimensional arrays?

We'll leave you to puzzle that one out for yourselves. By the way, if you find out, could you let us know please?

The army game

In this program from J D Bateman — a General has to make his way back to camp, but rebelling soldiers make life difficult

The General does not necessarily rule OK with this game which shows how the Dragon's low resolution graphics can easily be used for board games.

The program is based on a game of strategy for two players: one assumes the role of General, the other the role of the rebelling soldiers. The General is to reach the safety of the camp or kill enough soldiers so as to make defeat impossible.

The aim of the soldiers is to surround the General and prevent him from reaching the camp and forcing him to surrender.

As players become more experienced in the game, the General is invariably forced to surrender. Players therefore usually play one game then reverse roles.

From this program you may be able to develop other games, using some of the graphics ideas included.

Variables	
A,B	values poked to give an on-screen score of remaining soldiers
S	number of soldiers
G	position of General
Z	indicates the status of the camp (either empty or occupied by a soldier)
SP	screen positions of the pieces
T	number of moves made by the General

How it works	
1-22	set up variables and draw the board
23-83	check and make the Generals' moves
71-72	play and print victory
84-167	check and make the soldiers' moves
168-180	instructions
181-182	play and print defeat

Floorway
TI-99/4A £7

Stainless, 10 Alstone Rd, Stockport, Cheshire

This is a difficult and intriguing game for the unexpanded TI. You must collect eight gems that are located along the screen. Only when all have been recovered can you enter the transporter that takes you on to a different layout.

The problem is how to reach the gems. There seems to be only one route possible.

Bricks are safe enough to walk on, but footrests have the alarming habit of starting to disappear while you are standing on them. Loitering too long on these may mean you are unable to use them on a planned return visit.

If all this weren't overwhelming enough, another factor is involved — your oxygen supply. A meter at the top of the screen indicates oxygen consumption. Should this run out before you reach the transporter, or you fall too far, then it's back to the beginning yet again.

There are two versions of the game on tape. One uses the keyboard to control movement, the other requires a joystick: each works adequately. **J.W.**

Meltdown
48K Spectrum
£5.95

Kerian, 29 Gisburn Rd, Hessle, Hull HU13 9HZ

Gone are the days when working for Acme meant you sold brushes door-to-door. In this offering you are working for Acme Nuclear Reactors, servicing reactors on the planet Haras.

A reactor has leaked and spread radioactive coolant through the nine rooms of the installation. Wearing a jet-propelled spacesuit, your task is to collect the coolant and return it to the centre room, at which point radiation levels will return to normal.

You are hampered by two alien life forms, Sdog, which is indestructible and therefore you just get out of its way, and Slab, which you can shoot.

There is also floating debris which can hole your suit so that you die instantly from radiation penetration.

The graphics are good, and I particularly liked the electrical zap room. Good use is also made of sound. My major criticisms are that there is no joystick option, no points system or hall of fame and I found the sprites moved a little too slowly for my liking. **M.B.**

The Bag Bounder/ Food of the Gods
TI-99/4A £7

Stainless, 10 Alstone Rd, Stockport, Cheshire

These two games are described as being suitable for the youngest member of the family (though how young is not specified), or the arcade novice. Both are very similar, but The Bag Bounder is the easier of the two.

In both, the screen shows a cross section of floorways with one-way or two-way ladders, or simply a tunnel for access to each floor. Various nasties guard the objects that you seek. In Bag Bounder this is bags of money, and in Food of the Gods you collect hearts stolen by an evil god.

The keyboard controls your movement. S and D keys control walking left and right and the spacebar is used to jump. When it comes to using ladders, however, you must find the correct key, which can be any of these, to take you up or down. This seems to be different for each location. While you are fumbling about, the resident monster has time to catch and gobble you up.

This peculiarity with the key movements is described as encouragement for the habit of self discovery, essential to all aspects of learning. I found it irritating and ultimately boring. **J.W.**

Fast-action fun

Here's a selection of the latest arcade games for you to savour. Read the advice of our experts to help you decide

Enduro
48K Spectrum
£7.99

Activision, 15 Harley Hse, Marylebone St, London NW1

Enduro is a car race which starts in one of the states of America, and finishes up in the same place.

According to the description on the package you go through Baja's scorching desert sands, through Montana, Tennessee, New England, and back again. You don't accomplish this in one day of course, you do get a sense of driving through the night, as well as through the day.

The usual control options are offered to you, and they are very simple: left/right brake/faster. The road and the scenery scroll towards you, thus giving the impression that the car is moving forwards. It's similar to those large test-your-driving-skill machines in amusement arcades.

If you bump into another car you don't disintegrate, you just get slowed down for a while. I found it interesting at first but after half an hour I had had enough, it began to get boring.

The graphics are nothing special, but everything does move smoothly, and the response to the controls is positive. Playable, but not addictive. **B.B.**

★ ★ ★

River Raid
48K Spectrum
£7.99

Activision, 15 Harley Hse, Marylebone Rd, London NW1

You are in a low flying aircraft, and your mission is to destroy all the bridges you come to whilst following the path of a river.

This is one of the few times that I wish I had a joystick, although the keyboard controls are simple. The reason for this is that I got so involved that my fingers became numb after about two hours, just using left/right and fire.

The scenery scrolls towards you, giving you the impression of moving forwards. All the time you are blasting bridges, the enemy is after you with aircraft, tanks, ships and balloons.

Of course, you soon run out of fuel, so you have to find fuel dumps in the river and fly over them. Some of the hazards are very cleverly placed, if you miss them you hit your fuel dump. The further up river you get, the more dangers you face, including very narrow river banks.

The graphics are ordinary ships, tanks, etc, and everything works smoothly, I found it a very addictive game. As soon as my fingers have recovered I am going to try again. **B.B.**

Interactive games on the Spectrum

Want to know how to redefine existing characters? HCW regular David Nowotnik shows you how

According to the Sinclair handbook, despite the complex layout of the display file, interactive games are easy, as you can detect a character at any screen position with the function SCREEN$. However, what the handbook doesn't tell you is that this function will only detect characters in the Spectrum's existing character set. SCREEN$ does not work with user-defined characters, which, if you want your game to look good on the screen, are just the characters you will want to detect.

Fortunately, there is a relatively easy solution to this problem — redefine some of the existing characters to the characters you want. How? Read on and I'll explain.

The Spectrum's character set (the data which defines which dots are INK and which are PAPER) exists in ROM. You can't change them in ROM, but what you can do if you want to alter some is to transfer this data to a safe place in RAM, where they can be altered, and change a system variable which is called CHARS in the handbook. This system variable tells the computer where to start looking for the dot pattern when PRINTing a character on the screen.

The first thing you must do is create a safe place in RAM to store the character set. This can be done by lowering RAMTOP, but this will be different for 16K and 48K machines. The following instructions are for the 48K Spectrum; if a different value is required for the 16K Spectrum, this is shown in square brackets. Lower RAMTOP with the direct command:

CLEAR 64599 [31831].

This will leave enough space for the normal and UDG character sets. Now copy the character set from ROM to the safe area with:

```
10 LET x = 64600 [31832]
20 FOR i = 15616 TO 16383
30 POKE x, PEEK i
40 LET x = x + 1: NEXT i
```

Finally alter the value of

You can use the following short routine to redefine any character of ASCII code between 32 and 127 with the following routine; you enter your column of numbers one at a time, from the top down:

```
10 INPUT "Enter character code"; x
20 LET x = x + 64334 [31576]
30 FOR i = 0 TO 7
40 INPUT y
50 PRINT i,y
60 POKE x + i,y
70 NEXT i
```

You could, if you so desired, alter all 96 of the existing character set, then return the computer to the original set with the commands:

POKE 23606,0
POKE 23607,60
CHARS with the commands:

POKE 23606,88
POKE 23607,251 [123]

All should appear quite normal, except that your Spectrum is now accessing the copied character set every time something is printed on the screen. You can now redefine any character you want.

The easiest way to do this is to use a special program designed for that purpose or design your characters manually.

Take a sheet of paper and draw an 8 x 8 grid. Decide which squares will be "on" and which will be "off" in your new character. Mark those "on" with a cross. When you have finished, work along each row of the character, and assign the following value to a box if it is "on":

Add up the total for each row and write that value alongside the row. In the above example, dots with the value 64, 16, 2, and 1 are "on", therefore the row total is $(64 + 16 + 2 + 1) = 83$. When you have finished, you should have eight numbers all within the range 0 to 255.

128	64	32	16	8	4	2	1	
	X		X			X	X	= 83

Dive, dive, dive!

David Hughes' program about submarine warfare takes you down beneath the surface of the Interface straits, hunted by enemy shipping
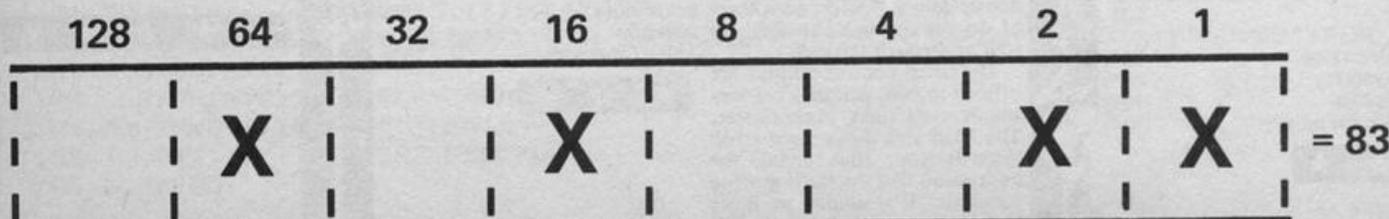

In this game you command your own submarine, called the Spectrum. Your task is to intercept enemy shipping in the Interface straights. You are armed with ten torpedoes (five per tube) and your mission is terminated when all your ammunition is exhausted.

The difficulty of the game lies in the fact that you must judge the range and speed of your targets, which vary in length from eight to 40 pixels long. You must also check each craft for flags: your friends have flags and your enemies don't.

The score gained by sinking enemy craft depends on their range. If one escapes then you lose 50 points. If you sink an allied craft then you lose points equivalent to twice the points you would have gained if it had been an enemy ship.

A good score is anything over 500 points. If you reach 600 you're doing really well.

Variables

hsc	highest score
sc	score
t1	number of torpedoes in left hand tube
t2	number of torpedoes in right hand tube
L	position of left hand torpedo
R	position of right hand torpedo
h	horizontal craft position (RND)
s	craft selection (RND)
f	flag selection (RND)

How it works

40-60	initial game preparation: establish high score, display instructions, set UDG, draw bows
70-90	set individual game variables, fill torpedo racks
100-200	game supervisor loop: check score, specify random elements
1000-2000	secondary supervisor loop: sort all random features, call for execution of sub-routines
2000-2220	sub-routines for craft assembly
3000-3500	subroutine: check if torpedo is fired, report when each tube empty, update torpedo rack display, check for hits
3600-3990	sub-routine for explosion, update score
4000-4500	finish routine: check current score against high score, clear screen for next game
5000-5250	sound sub-routines
8000-8090	instruction sub-routine
9000-9290	graphic assembly, report strings routines
9400-9640	draw torpedo rack and bows of submarine

Programming hints

1. REM statements: Loop and sub-routine headings in upper case, REM notes in lower case.
2. Ship bows (2030 and 2110): graphics A in inverse video mode, bows (2160). Graphics B in inverse video mode.
3. Submarine's bows (9510): inverse video mode; graphics A; 2 x space: B, and adding two extra spaces for each line
4. The two space prints, line 1120, are five and four spaces respectively.
5. POKE 23607,49 scrambles print giving explosion effect. Character set restored by POKEing 23607,60

Air Traffic Control
48K Spectrum
£9.95

Mikro-Gen, 44 The Broadway, Bracknell, Berks

Though a substantial program, Air Traffic Control loads very quickly using Mikro-Gen's Hyper Load facility. It is fascinating to watch, and interesting to play. It's a simulation of controlling a section of air space.

The planes are shown with a market and their call-signs on a simulated radar screen which overlays a map of the area. Beacons and air lanes, and a danger area are also shown. You must give each plane it's own air space, at a height and speed such that no collisions occur, and then hand it on to the next sector.

Military aircraft which are not under your control cross your sector as do slow moving twin prop aircraft. You must ensure adequate separation, even when a 737 depressurises and has to drop in height.

Much more information such as destination and aircraft type is also given, so that even on level one your interest is held. Level nine is so crowded that not even a real controller could cope.

The package has a keyboard overlay and a manual which must be studied.

As absorbing as a flight simulator, but different!   **D.M.**

Scrabble
32K BBC £12.95

Leisure Genius, 3 Montagu Row, London WH1 1AB

Have you ever come across a game that's so testing and so addictive that getting bored with it would require playing it twenty five hours a day, eight days a week?

Now you can play, without doubt, what must be the best game ever written for the BBC. It's not only great entertainment but also superbly presented, with one of the best instruction booklets I've ever seen.

No-one needs reminding that Scrabble is a board game which involves the placing of letters on a chequered type board to form words, but all words must join others, crossword style.

The computer has a vocabulary of over 8,000 words, and it proves a worthy opponent. There are four levels of skill: level 1 is beatable but level 4 is way above my standard, but is suprisingly fast at about one minute per move.

The Mode seven board takes some getting used to, but after a while you get to know it like the back of your hand.

Thanks, Leisure Genius, for a magnificent game that can only be described as next to perfect.
M.B.

★ ★ ★ ★ ★

CDA
Oric £3

NJH, 66 Dudley Rd, Brighton, Sussex BN1 7GL

CDA is a rather simple character generator.

When the program is run, you are asked to enter the character you want to redefine. Here's the first snag. You can choose a normal ASCII character by pressing the appropriate character but to enter characters not directly available from the keyboard, you enter the ASCII code. This may sound reasonable if you could see what figures you're typing in. There's no cross reference so you must look up the ASCII code in the user's manual.

The editing isn't very sophisticated either. You design your characters in the usual cursor-on-a-grid fashion but there are many short-comings. For a start, there is no wrap-around and there are no useful facilities such as rotate, invert and clear. There is no facility for defining more than one character at a time either.

Perhaps the most frustrating part is that you cannot see your character in actual size as it is being edited and you are not given the necessary values for the redefined character. To top it all, you cannot save or load the redefined characters from within the program.   **S.S.**

Words and wings

Find out how good you are at the English language or save lives at 20,000 feet

Kensington
CBM 64 £12.95

Leisure Genius, 3 Montagu Row, London W1H 1AB

This is definitely a thinking man's game — no quick-reflex, laser-zapping for arcade freaks. It is a board game which requires skill and strategy.

When first released, Kensington was billed as the best game since Monopoly. It failed to justify expectation. This computerised version doesn't really improve matters. Although, in all fairness, it does provide an opponent.

For those not familar with the original game, the board/screen displays a number of interconnecting hexagons. In the first stages, counters are placed on the board. In the second stage, players move the stones in an attempt to occupy the six points of a white hexagon, or a hexagon of their own colour.

The controls are a bit awkward and slow. It would be a good idea to make use of the joystick instead of the keyboard. Plenty of options are provided at the start for varying the game. Three levels of play are available, and the hardest plays a testing game.

Perhaps this version will appeal to board-gamers, but it didn't really excite me. Despite attractive packaging, I found the price a bit steep.   **T.M.H.**

Lingo
32K BBC £12.95

Complete Microcomputer Services, 32-38 Osnaburgh Street, London NW1 3ND

I have often had the feeling that there should be more computer games for several players. This program is designed for one to four players, although the fascination of playing on your own is hard to see.

You are dealt, in a very long-winded manner, 12 words from the computers' list, and you have to try to make these into a gramatically correct and meaningful English sentence.

You have a whole series of joining words and word endings available and you score by the complexity of the sentence you build.

Needless to say the computer can't understand your sentences, so your fellow players have to approve your work before scoring.

The sentences have to make sense but can be surreal, extraordinary or just plain silly. In short this is a word based game which would be better played using cards.

The only thing that the computer does well is provide a score. Everything else is made more complex by using the machine.

It might be fun the first time, but I cannot see anyone really spending an evening round the micro just to play this game.

★ ★ ★

This exciting game by Andrew Clarke stars you as the pilot battling against the elements. Can you stay the course?

Crippled helicopter: can you survive?

You are the pilot of a crippled helicopter and you must land your hopper on one of the heli-pads. Your fuel is running low and you are also hampered by the strong gravitational field which is pulling you to earth.

There are five spots where you can land and you will need to exercise all your skill in manoeuvring your helicopter. Be careful to monitor your speed: if it exceeds 20mph when you come in to land, you will blow up. Your craft will also be
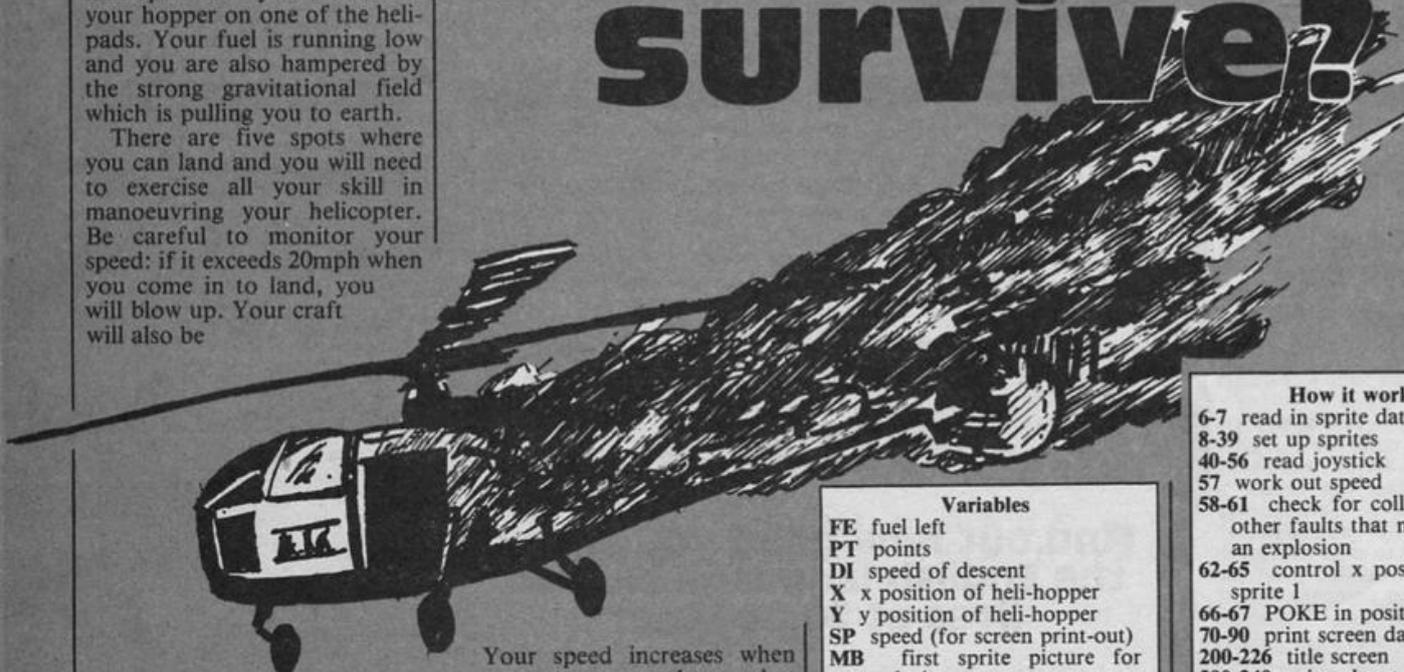

destroyed if you touch the planet scape, if you run out of fuel or if your speed is greater than 100 whichever way you are travelling.

A read-out next to the speed indicator will tell you whether your speed is good or high. You will have to use delicate joystick control to keep your speed down.

Your speed increases when you go up or down, but remember that gravity increases the pull on you when you are descending so you will move faster. The explosion routine at lines 400 to 410 is identical to the one used in Spaceshot Nimbus by the same author.

These are your control keys: 1 up, **left arrow** down, 2 right, **CTRL** left, **space** fire (used to start game).

Variables

FE	fuel left
PT	points
DI	speed of descent
X	x position of heli-hopper
Y	y position of heli-hopper
SP	speed (for screen print-out)
MB	first sprite picture for explosion
MU	value for sound
PO	indicates if sprite is past the 255th x position
JS	joystick value
VO	volume
SU	sustain
AT	attack
WA	waveform
HF	high frequency
LF	low frequency
CA	cause for explosion

How it works

6-7	read in sprite data
8-39	set up sprites
40-56	read joystick
57	work out speed
58-61	check for collisions, and other faults that may lead to an explosion
62-65	control x positioning of sprite 1
66-67	POKE in position values
70-90	print screen data
200-226	title screen
300-340	print planet surface
400-410	explosion routine
450-454	message following explosion with reason for crash
460-466	message following landing
470-478	another GO? if crashed
480-488	another GO? if landed
490-496	high score
500-520	sound
30000-30052	sprite data

Astounding adventure: amazing arcade

Whatever your taste you should find something to suit you here. A high quality set of games, chosen by our experts

Jet Pac
BBC B £7.95

Ultimate, The Green, Ashby-de-la-Zouch, Leics LE6 5JU

Ultimate's new game for the BBC sets a new standard in fast-moving graphics, and also in alien genocide! It is a game of the hovering spaceman genre.

The idea of the game is to move an astronaut around the MODE 2 screen using a Jet-Pac to collect fuel and components for a spaceship in order to blast off to the next planet.

The astronaut has a powerful laser gun with repeat-fire facility which can destroy aliens in flocks. This does not make the game easy, however, as there are lots of aliens and the Jet-Pac controls are very fast and responsive, making it difficult to control.

Each planet contains a different type of alien, and according to the packaging there is a universe of planets. So far I have seen three!

Also on the planets are bonus objects such as gold bars and liquids, which float down the screen and stay for a few seconds before disappearing.

This is a fast, colourful arcade game with good graphics and excellent sound. I liked the opening music. Perhaps the game is a bit repetitive, but good fun to play overall. **D.A.**

★ ★ ★ ★ ★

Scandarally
TI-99/4A £3.50

Softi, 14 Station Rd, Brough, N Humberside HU15 1DY

This is a car rally game which takes place in three stages. You guide a car down a forest path avoiding the trees and huts that scroll up the screen.

Providing the car is not too damaged to continue, you then steer along a winding mountainous path before crossing water over a steep bridge. In the final part you drive along a crowded motorway, dodging the traffic.

At the end of each stage the number of penalty pionts gained are shown. You have three cars with which to compete. Your final score depends on the number of stages completed and any bonuses awarded, minus all penalties.

At the end of the game a Hall of Fame shows the score and your place in it, but there is no best score feature incorporated.

The S and D keys control left and right movements of the car, but some numeric keys can control speed and cornering. I found trying to use these most difficult, partly because of not being very dextrous, but mainly because they do not work as expected.

This game needs Extended BASIC. **J.W.**

★ ★ ★

Pyjamarama
48K Spectrum
£6.95

Mikro-Gen, 44 The Broadway, Bracknell, Berks

Add the plot of Jet Set Willy to graphics about four times the size, and much more detailed, and you get this pyjama drama featuring a sleep-walking Wally Weeks.

Using a variety of joysticks or definable keys, you must guide the bed-capped hero through the house avoiding multitudes of bouncing or spinning Whotsits, to find the alarm clock, which will wake him up in time for work.

As you progress, you find objects, only two of which can be carried, to aid you. These include keys to open locked doors. You are sustained by snooze energy which is lost when a Whotsit grabs you, and is restored by eating the food.

If the plot's not original, then why buy it? First, it's cheaper, and second, these graphics really are super, with great detail and very smooth animation.

My number one tester loved the way Wally can be made to slide down bannisters! An enormous variety of articles assail you, and in the Video Game room, there's even Space Invaders played with roast chicken, and knives and forks.

Good fun, even if not original! **D.M.**

★ ★ ★ ★ ★

ZimSalaBim
CBM 64 £9.95

Melbourne Hse, Castle Yard, Richmond TW10 6TF

This is an adventure game set in Arabia.

The top half of the screen is devoted to a hi-resolution picture of the action. These pictures are not static but scroll smoothly across the screen as you move your character about.

The object of the game is to carry out a raid on the Sultan's fortress and recover some stolen gold. You then return to the desert and locate a secret cave to return the gold to the village elders who are waiting there.

Playing the game is a mixture of moving the character around the screen via the joystick or keyboard and entering two word commands. This is accompanied by mysterious music.

This is a nicely thought out game for the apprentice adventurer. The range of text commands is not so vast that you spend hours at one point. The graphics help the realism and I like being able to use the joystick.

The game uses a fast load system so it loads in only three minutes. **L.C.**

★ ★ ★ ★ ★

Kokotoni Wilf
48K Spectrum
£5.95

Elite, 55 Bradford, Walsall WS1 3QD

Going in search of the pieces of a shattered Dragon Amulet, Kokotoni Wilf is the winged apprentice of the magician Ulrich.

He has been transported back into a time when there were dinosaurs stalking the earth, although these particular creatures are immobile, it's dangerous even to touch them.

He must dodge various flying creatures, and the obligatory spiders of course, and he wanders in and out of various locations, under your control.

The controls are very simple, left-right and up, are all that are required, and Wilf moves smoothly in response.

The plot may differ slightly, and the scenery is a little different to many, but the game follows the well worn path of previous graphic adventure games.

Not, I hasten to add, that this game isn't playable, it is, but it's not what I would call addictive... not many are.

Probably the best classification is that it is average in its class, which means that it is better than some, and worse than others. **B.B.**

Stop cheating

Having read Paula Le Page's letter in HW 84, I feel that I must reply to some of her comments.

Firstly I would like to say that I agree whole-heartedly with her view that the HCW letters page should not be turned into a cheats page by the people who can't complete the various adventure games that are always being mentioned. Surely it spoils the fun of a game if someone gives you all the answers and it stops you getting as much value for money out of your software. When I've spent £5 or more on a game I'd rather do it myself, thank you.

It also spoils the letters page for those HCW readers who don't want to cheat as some weeks there's nothing on the page I can read without it spoiling my fun by giving me the answers to one of my games.

I must admit that I sometimes get fed up with the number of letters etc. in HCW for TI-99/4A owners (I own a Spectrum 48K) but I can see their point. I would be very worried about the future of my computing hobby if the Spectrum were ever to go out of production. However I do think there should be more of a balance in HCW, after all Spectrum owners are in the majority so it is quite logical to have more material for this brilliant computer than for any other and I think all reasonable people must agree with this.

I think HCW is a great magazine and the only thing that needs changing is the letters page. I want to see more interesting letters being published — like this one!

Henry O'Donovan, Torquay

Changing scene

I was very pleased to see (HCW 84) that at last your letters page has cut out the dross of how to cheat on various boring games. It's much more interesting to read other people's points of view and I hope this will continue.

You must admit, HCW, that your pages have been rather thin over the summer. We're all looking forward to bumper Christmas issues like you released

last year, and lots of reviews and even more reviews.

I think that the computer has changed quite dramatically over the last year. If you just think back to this time last year, everything's so different. Not only have many software companies smartened up and improved their marketing — in short, become more professional — but we all common or garden users are also growing up a bit in what we like to buy or type in to our computers.

Of course, we're going to miss the sparks of originality and the novelty, but I think it can only be for the good in the long run. Amateur companies may be fun while it lasts, but once the industry has progressed as far as it now has, it's important to maintain some kind of credibility.

If you want to know my forecast for the near future, I think that we users are going to get more and more sophisticated and utilities and business programs will dominate. Of course there will always be the games freaks, and I admit that I enjoy playing games, but I think that there will be more and more snobbery: who's going to admit to spending hours and hours playing arcade games when serious users will be expanding their brains with graphics and utilities?

It will be interesting to see how all the computer magazines are going to react to the shift in the market. There are so many computer magazines that it will be vital for them to adapt to cater for the public's needs. Perhaps we'll see new magazines springing up which cater for the young (and the not so young) amateur programmers and even those who just like tinkering with their micros. Can you imagine it — Your Utility or Utility Computing Weekly. Perhaps we'll see those titles in the near future, who knows?

Chris Gibson, Oxford

A useless hobby?

I have a problem and I was wondering if any other HCW readers are having the same difficulties.

I own a Commodore 64 which I got for my birthday last year and I spend quite a lot of time using it. Now my parents say that I am wasting all my time playing games on it and that they never see me because when I

come in from school I go straight to my Commodore and start using it. They say that I am neglecting my school work and that I should be working for my 'O' Levels instead of mucking around on a useless hobby. Do other readers find that their parents stand in the way of this excellent pastime or am I the only person with this problem?

I try to explain to them that I am spending my time usefully. I am teaching myself to program and am getting quite good at it. Computing is used in many jobs nowadays so I think that my hobby will help my career prospects too.

What can I do to make my parents see that computers aren't a waste of time? They say that they wish they hadn't bought it for me.

John Ramsbottom, Manchester

Belgian record?

I finished the fantastic game Sabre Wulf with a score of 355,720 points and 97 per cent of the game. I suppose this is a continental record. It took me two hours.

Steven Harien (age 10), Belgium

Nutty about adventures

May I congratulate you on the continuing high standard of HCW. Keep it up. Perhaps a bigger space for adventure nuts, hint, hint! (some *is* bigger than none).

If there are any CBM 64 owners/readers in my local area who would like to swap hints etc, then I would be delighted to get in contact. I can offer some help with the following adventures; Hobbit, Heroes of Karn and any of the adventures published on 64 Tape Computing numbers 1, 2 and 4. These tapes, produced by Argus, are really great and at £3.99 are great value, so far, as considering that all four, so far, are packed with tips, hints, games, utilities etc, including adventures on the issues mentioned above. I can recommend them to all 64 owners.

If anyone else, either home or abroad wants to write with help, or just for the sake of writing, please do. I will answer all mail.

I am 27 and will accept mail from any age group, providing they are 64 users and enjoy adventures.

Ian Robertson, 18 Cedar Hse, Spelthorne Grove, Sunbury, Middx

We have no connection with Mr Robertson and have not paid him to write flattering letters about Argus! Adventure buffs will be pleased to learn that we will shortly be featuring an adventure column, so write in with your problems or advice.

Thumbs down

I am writing to warn HCW readers of a new program from US Gold. After being advertised as early as August, Nato Commander was finally available in October. As there is a shortage of war simulation programs for the Commodore 64 I purchased it immediately.

The instruction book mentions a demonstration mode; this did not exist on my copy. However, worst of all I find that there is no facility to play again on completion of a game. It must be reloaded from the start which takes about five minutes, a situation which is obviously unacceptable.

This lack of attention to detail is not what I have come to expect from US Gold who in my experience has produced excellent software in the past. I, for one, am sending my copy of Nato Commander back and demanding a refund. I shall certainly be more careful when buying from them in the future and my advice to HCW readers is... save your money!!

Paul Nash, Cheadle Hulme

Shame on you!

You should be ashamed, HCW. I'm referring to Bernadette Barron's letter (HCW 84).

The attitude that it's OK to copy software and records is rife. When you buy a program, record or TV licence you pay for the right to use that information. If you want to transfer that program, music or programme on to another medium it is within your legal right, so all those people who copy programs to disc, and records to tape and video-record Blankety Blank aren't breaking the

law if they do it for their own use.

If they then give (or sell) the tape to someone else they are cheating the company who produced the goods out of the money which is their due. In the case of video recordings this does not usually matter because most people who have a video recorder will have a TV licence and will have paid for the right to see the programme anyway. However both music and software cost a lot of money to produce. An average program may take three months to a year to develop: the programmer has to be paid during that time, so that he can afford to eat, sleep and scratch his head at regular intervals. If you pirate his game he does not get the money you owe him.

A programmer gets about 15 per cent of the selling price of his game — there are huge costs involved in manufacturing, packaging, distributing and advertising software. To recover costs it is necessary for the software house to sell more than 20,000 copies of each program. If one title fails another has to subsidise this loss.

The days of rich software houses and programmers driving Porsches are over and if you insist on stealing their work they won't be able to afford to produce the goods and you will suffer. If people spend money producing a marketable item they are owed something for your use of it. The argument that software is too expensive does not wash; there are many things I would like but can't afford but that does not give me the right to steal a mainframe!

Jerry Fowler, Croydon
