From the publishers of
ZX
COMPUTING

A NEW, IMPROVED ZX81 KEYBOARD AT THE SAME OLD PRICE. £9.95.

There's only one thing wrong with the ZX81. Its keyboard.

Or rather its lack of one.

Since it's flat your fingers don't feel as if there's any response to the pressure put on the keys.

ZX81 KEYS

FILESIXTY KEYS

In other words, you're not quite sure which keys you've pressed until the screen actually tells you.

Our new, improved push button keyboard changes all that.

It matches the ZX81 perfectly. And the keys give a real calculator-type feel.

To set it up all you have to do is peel off the adhesive backing and stick it on top of the ZX81 touchpad.

Because no tampering or soldering is involved the guarantee is not affected. And it will last for up to 3½ million operations.

Filesixty Ltd., 25 Chippenham Mews, London W9 2AN, England. Tel: 01-289 3059. Telex: 268 048 EXTLDN G 4087.

But our keyboard doesn't just come loaded with features. With it comes a separate overlay and a set of coloured stick-on labels to make game playing easier.

It's yours for the original price of £9.95.

Whichever way you look at it, we think you'll agree that it's a keyboard that's quite outstanding.

Orders to Filesixty Ltd., FREEPOST, London W9 2BR.
Cheques/PO made payable to Filesixty Ltd.
Please send me _____ (qty.) Keyboards at £9.95 each
(including VAT and P&P).

Subscription Rates: UK £8.40 for four issues including postage. Airmail and other rates upon application to Personal Software Subscriptions, Infonet Ltd, Times House, 179 The Marlowes, Hemel Hempstead, Herts HP1 1BB.

| | | | |
|--|----|--|----|
| Preface | 4 | User Character Set | 46 |
| Invincible | 5 | All sorts of characters on the ZX81. | |
| Try playing hard to get — the aliens are out to get you! | | The Sharp End | 48 |
| Motor Madness | 6 | Three great little games to get you going! | |
| Enter the Grand Prix and drive yourself mad. | | Muncher II | 50 |
| Caterpillar 2 | 8 | Try to escape from the monsters. | |
| Watch out you don't become addicted! | | The Right Chord | 53 |
| Crazy Ballooning | 10 | Tricky guitar chords made easy. | |
| Fly high and fast and watch out for low-flying aircraft. | | Enemy Satellite | 55 |
| Talking Turkey | 12 | Home in on the enemy. | |
| Let your micro create a new dictionary. | | On Target | 56 |
| Worms | 13 | Two great programs — Target and Missile Launcher. | |
| Surround yourself in machine code. | | Smaug's Lair | 58 |
| Backgammon | 16 | Can you destroy the dragon's lair? | |
| See if you can bear off before the computer. | | Naval Manoeuvres | 62 |
| 3D Mover | 22 | Get your fleet in action. | |
| Create three-dimensional objects in 16K. | | House of Horror | 66 |
| Just another Brick | 24 | I hope you're not faint-hearted | |
| Build yourself up to playing games. | | Drop Out | 68 |
| Number Tumbler | 27 | A ZX81 version of the old arcade game. | |
| Is your number up? Read on and find out. | | Maths Maze | 70 |
| 3D Cubes | 28 | A great game with an educational twist. | |
| Three-dimensional representations of cubes on the ZX81. | | Naught But A Game | 73 |
| Grand Prix Driver | 31 | Don't get cross at the noughts. | |
| Strap yourself in and prepare for the race of your life. | | Peeper | 76 |
| Equation Solver | 36 | A paranoid program, so watch out! | |
| Solve equations using the bisection method. | | Five Card Trick | 78 |
| Minefield | 39 | A fabulous implementation of the card game, Pontoon. | |
| You really must watch your step. | | Profit Prophet | 81 |
| Death Race | 41 | Serious stuff to help you get to grips with your business. | |
| Drive your ZX81 to the limit! | | Stock Control | 85 |
| Towers of Hanoi | 42 | Keep efficient control of your stock. | |
| The ZX81 solution to this age-old puzzle. | | Air Raid | 88 |
| Sheepdog Trial | 44 | Run for cover and have a smashing time! | |
| Head 'em up and move 'em out! | | Coding Graphics | 92 |
| | | Increase your character size with this utility. | |
| | | Spiralling into Graphics | 96 |
| | | Become artistic with a spirograph program. | |
| | | Shooter | 98 |
| | | Simple but fun to play. | |

PREFACE

What's this, I hear someone ask — a magazine for the ZX81? But surely the ZX81 has had its day and is now no more than a memory? Well, if you are sitting comfortably I'll try to explain...

At a rough estimate, there a million ZX81s out there in computer-land, and even allowing for those people who bought one as a 'one-day wonder' or have 'progressed' to a more sophisticated microcomputer, there must be an awfully large number of micro owners out there who regularly plug in their ZX81. But have you tried to find some exciting new software lately in your local high street store for the ZX81? I'd like to hear from anybody that has had recent success in this venture!

It would appear that the software manufacturers have decided that the ZX81 is no longer a viable launchpad for new programs and now devote their time, money and effort to the more profitable machines — and who suffers most? You've guessed it — the multitude of ZX81 owners. And there, dear reader, is where we have stepped in.

This issue of *Personal Software* is intended to fill the gap left by the commercial suppliers. Most of the programs to be found in these pages were originally printed in our sister magazine, *ZX Computing*. The game of Backgammon appeared first in *Computing Today*. Since they first appeared in print, we have carefully checked them to make sure they contain no errors, and so if you experience any difficulty in getting any of the programs to work, please check them again. If you are still having problems you should write to *Personal Software* stating clearly what problem you have encountered and enclosing a stamped self-addressed envelope. We regret that we cannot answer telephone enquiries.

INVINCIBLE

Try playing hard to get in this program — the aliens are out to get you.

The object of this game is to shoot the alien spaceship five times before it gets to shoot you. You use the 'I' key and the 'Q' key to move left and right respectively. You can fire at the spaceship using the 'O' key.

You must make sure your shots are aimed at the black squares of the spaceship — all other hits are counted as naught. The winner of the game is the first one to get five hits. The seemingly random firing of the spaceship is accomplished using the RND function.

The game is great fun to play and beating the spaceship is no easy task!

CATERPILLAR 2

Watch out you don't become addicted.

You'll need some skillful playing if you reckon on getting out of the field in one piece in this program.

The object of the game is to guide a caterpillar through a field eating cabbage leaves (made up of 'fuzzy' squares). The caterpillar must avoid touching the walls (made up of inverse spaces) and eventually escape through a small gap in the wall.

The game has a high score facility, which asks for your name if you have beaten the previous player's high score. There

are three skill levels, but you won't be able to get onto level three unless you have managed to score 1,000 points or more.

PROGRAM STRUCTURE

Lines Description

| | |
|-----------|--|
| 10-115 | The instructions and the skill level. |
| 200-500 | The main body of the program. |
| 600-660 | The high score facility. |
| 1500-1530 | The routine to decide the skill level. |
| 2000-2010 | The routine to decide whether a player is eligible to play on level three. |

The listing for Caterpillar 2.

AGF Joystick Interface II for Spectrum or ZX81

Now the AGF Interface II is even better value. Since we pioneered the cursor-key interface in October 1982 there are now over 100 games or utility programs with either the AGF option or cursor key controlled - that makes it unbeatable at this new low price.

Still incorporating the all important rear expansion connector which means other peripherals can be connected at the same time i.e. Ram Packs, Printers, Speech Units etc, and of course the key replication principle used guarantees this will never conflict electrically with any other add-ons.

When you feel like upgrading to a more flexible joystick system you can claim 12.5% off the purchase price of our Programmable Interface.

All AGF Joystick interfaces will work with any industry standard joysticks using 9-pin 'D' plugs - including QuickShot II and the new Trackball controllers.

Don't settle for less choose AGF.

Joysticks

The choice is yours. The standard QuickShot is excellent value incorporating suction cups for sure-footed precision and a comfortably contoured handle with a convenient top firing button, plus conventional button in the base.

Four feet of cord terminates in the industry standard 9-pin 'D' plug for compatibility with our interfaces or direct connection to a selection of home micros.

The new QuickShot II has improved styling with a trigger type firing control as well as the top firing action and a broader base for greater suction stability. The rapid fire switch, which allows a continuous stream of shells where normally a button press is required for each one, is located in the base for easy access in use.

Cord length and termination is as the standard QuickShot controller.

CRAZY BALLOONING

Take part in an aerial assault course.

This is an adaptation of the popular arcade game for the ZX81. You have to guide the balloon around the course of prickly asterisks to reach the area marked 'GOAL' in the top left-hand corner of the maze.

You start at the bottom right-hand corner of the course and the controls you should use to guide your balloon are shown in Fig. 1. Obviously, the idea of the game is to try and get your balloon to the goal without it hitting the asterisks which, in case your bubble!

PROGRAM DESCRIPTION

Below is a brief breakdown of the program.

You can always take a short cut through one of the two gates in the asterisk wall — but take care, this is not always the easiest route!

| | |
|---------------|--|
| Lines 1-85 | Initialisation. |
| Lines 90-185 | What key has been pressed? |
| Lines 193-240 | What has the balloon hit? |
| Lines 255-300 | Swing routine. |
| Lines 400-520 | The 'balloon burst' and 'high score' routines. |

| | |
|-----------------|---|
| Lines 550-570 | The goal routine |
| Lines 600-620 | The bounce at the start of the game. |
| Lines 1000-1250 | The routine to set up the screen. |
| Lines 2000-2200 | The routine containing the instruction. |
| Lines 3000-3320 | The movement routine. |

This is the listing for the program, Crazy Balloon.

TALKING TURKEY

Using these rules, the computer tries to invent English words, and manages to do so surprisingly often. Around seven per cent of the output of this program

should be real words. The ZX81 uses knowledge of the frequency of occurrence of certain letters in words in English to dictate how often the letters are used in creating

This program has decided that although the English language does not exist, some of its rules do.

randomly generated words.

If you leave this program running for a million years it may well write the Gettysburg Address ('Three score and seven years ago . . .').

WORMS

This is a two player game, the object being to force your opponent to collide with a wall, your worm or your opponent's worm.

The game uses the full 24 by 32 screen, the walls being the black border around the screen. One worm is made from '+' characters, the other is made from '*' characters. The worms grow as you move around the screen.

Movement is in four directions; up down, left and right. Keys 'W' (up), 'A' (left), 'S' (right) and 'Z' (down) control the '+' worm. Keys 'O' (up), 'K' (left), 'L' (right) and '.' (down) control the '*' worm. A worm is killed if it hits a wall, hits the opponent's worm, collides with itself or moves back on itself. The game also has on-screen scoring for both players. Key 'F' returns control to BASIC and stops the program.

DOWN THE LINE

Looking at the main program. The machine code is held in the line 1 REM statement containing 532 characters. There is an easy way and a hard way to create such a REM statement. The hard way is to type in the 532 characters one after another. The easy way is as follows: create the REM statement in Fig. 1, that is, a REM followed by 100 characters. Edit the line numbers to form lines 2 to 5 and then enter line 6 (a REM followed by two characters) as

in Fig. 2. Next, execute the following as direct commands:

```
POKE 16510,0 (this ensures the
line cannot be edited)
POKE 16511,22
POKE 16512,2
```

A REM containing 532 characters has now been created, and the machine code program can now be entered using a hex-loader like that in Fig. 3. Incidentally, if PRINT PEEK 16511 + 256*PEEK 16512-2 does not give the answer 532 then you have typed in the REMs wrongly, and you should go through the above procedure again.

After you have entered the machine code program, you can check to see if you have entered it correctly, using the program in Fig. 4. When you are sure you have entered the machine code program correctly, you can now enter the BASIC control program. Save the program first by RUN 200, just in case something goes wrong.

TOO FAST?

To increase the speed of the game, type in the following as direct commands:

```
POKE 16912,X (Where X is a
value between zero and 255.
The lower the value, the faster
the game.)
```

If you can worm your way round the machine code, you'll find it's worth it.

POKE 16913,0

To slow the game down, type in the following:

POKE 16912,X (Where X lies between zero and 255. The greater the value the slower the game.)

POKE 16913,Y ('1' or '2' is usually a big enough value for Y).

If you would like to change the characters which form the worms, then change the '+' by typing in the following:

```
POKE 16838,C
POKE 16797,C+128 (Inverse of
C.)
POKE 16870,C
POKE 16880,C
POKE 16905,C
```

where C is the code of the required character.

To change the '*' worm, type in the following:

```
POKE 16850,C
POKE 16875,C
POKE 16900,C
POKE 16910,C
POKE 16813,C+128
```

The program, as published, was originally written for a 16K ZX81, although with the addition of a little bit of machine code it will run on a machine which has 3K of RAM, ie where the display file is not automatically filled with spaces. To make the program run in 3K, the machine code should be placed in a line 2 REM statement.

| | |

| RST 16 NEXTCHR | D7 |
| DJNZ NEXTCHR | 10 FD |
| DEC C | 0D |
| JR NZ,NEXTLN | 20 F8 |
| RET | C9 |

You should also insert this line in the program:

9 RAND USR 17053

The code creates a 24 by 32 display file, which is automatically set up on machines which have more than 3¼K RAM.

BACKGAMMON

Here's a classic game brought up to date with a program for the ZX81 that plays against you and obeys all the rules.

Fig. 1. The starting position for backgammon.

Backgammon is one of the more popular and enduring of board games, probably because it doesn't rely solely on blind chance and the throw of the dice, but requires an appreciation of probabilities and the skill to assess the most

effective use of your throws. This program puts a simulation of the backgammon board on your TV screen, and allows you to play against the computer. We aren't pretending that this piece of software could wipe the floor with Omar Sharif but it will put up a creditable fight,

and can usually be guaranteed to cause you the maximum difficulty if the dice are with it. The performance is especially good when you realise that there isn't enough memory in a 16K ZX81 for a look-ahead probability tree even one turn deep.

Just to make sure that you don't get tempted into cheating it, the computer checks out everything you enter against the rules of backgammon and rejects invalid moves. The one exception is the rule stating that if a player can only use one of the numbers he has rolled, he must, if possible, use the larger. This was in the copy of rules we obtained, but two backgammon players in the office said they'd never heard of it, so we decided to leave it out. If you play by this rule, it wouldn't require more than about five or six extra lines of code: this is left as an exercise to the reader!

SIMULATION

The working of the program is based on the two position arrays $W()$ and $B()$, which correspond to the points on the backgammon board. The board consists of 24 positions, or points, each of which may hold any number of pieces (of the same colour) up to the total number in play. The array elements $B(1)$ - $B(24)$ hold the number of black pieces per position, while the corresponding information for the white player is held in $W(1)$ - $W(24)$. For example, at the start of the game $B(1)$ is set to two, since there are two black pieces at position A on the board. During the course of the game these array elements are constantly changing.

Two further elements of each array are used in the game, these being $W(31)$, $B(31)$, $W(35)$ and $B(35)$. The

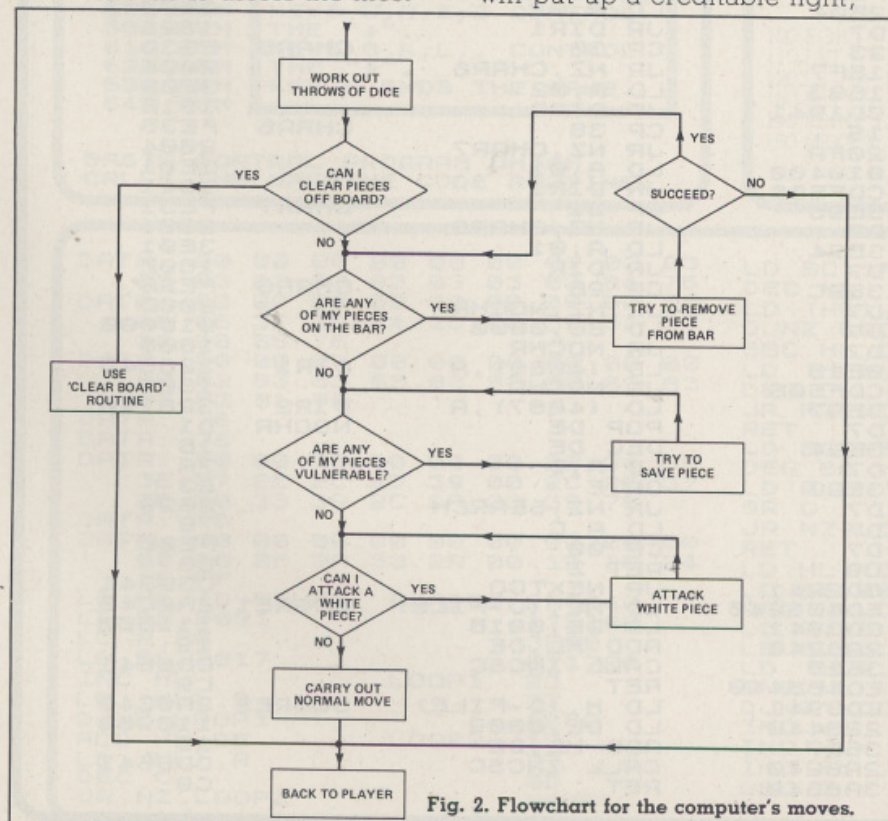

Fig. 2. Flowchart for the computer's moves.

first two hold the number of pieces each player has on the bar, while the second two hold the number of pieces each player has taken off the board at the end of the game.

The computer uses the position arrays to work out its move. For every move that the computer makes, the routine shown in the flowchart of figure 2 will be carried out. To give an example, suppose one of the computer's throws is a five. The program will look at each black piece, take the index of its position in the array and add five to it. It can then see the effect of moving the piece five places — whether the move is legal, whether a white piece could be taken, whether a position could be fortified and so on. If the computer is satisfied that the move is a good one, it is carried out.

Things get more complicated when the computer has to check whether a move that you have made is legal. The player's dice throws are stored in a third array, T(), to simplify the checking routines by using FOR-NEXT loops. If the dice throws are not equal, the two numbers are put into T(1) and T(2) in descending order (using T(5) as a temporary store) and the remaining array elements made zero. Otherwise doubles have been thrown, and the first four elements of the array are all made equal, T(5) again ending up as zero.

If a player's move is judged to be valid, the dice throw corresponding to that move must be tagged as 'used' by setting it to an 'impossible' value. We decided that the answer was to use 42!

Since the three arrays completely describe the state of the game with respect to piece positions and dice in play, the computer can run through a series of tests involving AND, OR and the arithmetic operators, one test per rule. As an example, the test that a player is genuinely unable to move is made between lines 1370 and 1460. For each unused throw of the dice and each point on the board, line 1400 checks that the corresponding

'destination' point for White really is blocked by Black. Then line 1410 checks that, if White is on the bar, he genuinely cannot move a piece back into play.

An added complication is introduced when White starts to bear off, since it is possible to use a dice throw greater than the distance the piece is moved.

Additional logic between lines 690 and 770 takes care of this.

PLAY THE GAME

It is assumed that the user of this program already knows how to play backgammon — it is not a teaching aid. The following instructions are merely to show

| VARIABLE | FUNCTION |
|-----------------------------------|--|
| C (= M) | Random number used for computer's first throw |
| D (= V) | Random number used for computer's second throw |
| G\$,GG | Player's move (from) |
| H\$,HH | Player's move (to) |
| DD | Distance of a player's move |
| F,J,K,L, N,S,Q,T, U,X,CC,TT | General purpose loop counters and flags |
| W() | Position array for white pieces |
| B() | Position array for black pieces |
| W(31) | White pieces out of play on the bar |
| B(31) | Black pieces out of play on the bar |
| W(35) | White pieces moved off the board |
| B(35) | Black pieces moved off the board |
| T() | Array containing White's dice throws |

PROGRAM STRUCTURE

| | |
|---------|--|
| 10-190 | Dimension and initialise arrays. Initialise variables. |
| 200 | Generate a random number and decide who goes first. |
| 220-350 | Throw random numbers for player's dice and display them. Sort them into descending order for testing later. Check for doubles and amend loop counter and array if necessary. |

Inputting player's moves

| | |
|---------|--|
| 370-540 | Display appropriate prompts and accept input. Convert strings to character codes, then subtract offset to put them in the range 1-24. Make preliminary validity checks, and alter GG or HH to appropriate values if "BAR" or "REST" have been input. |
| 550-610 | If White is bearing off, check that move is |

how to play the game with the ZX81.

The player always plays White and should move in an anti-clockwise direction from X to A (see the photographs). When the program is first run, the computer may move first: if this has happened, the computer's dice throws and moves are displayed at the top of the screen. To throw your own dice, press any key, and after eight seconds or so the computer will display the board and your throws. This will happen anyway if the computer has allowed you to move first. (If you would prefer the computer to automatically throw your dice for you after an eight-second pause, delete lines 3190-3210 and change line 3320 to

3220 PAUSE 400

Pressing any key will terminate the pause early, and you can change the delay to suit your needs).

The player will then be asked for his move with the prompt "YOUR MOVE FROM" — you should enter the letter of the point you want to move from, then press NEWLINE. The prompt "TO" then appears, and the destination point is entered in a similar way. If the move is invalid, the computer will say so and repeat the above procedure.

If you can't move you should reply "NO" to the prompt "YOUR MOVE FROM" and the computer will make its next set of moves. If you've made a mistake in entering the "MOVE FROM" letter, you can cancel the move by typing "NO" in response to the "TO" prompt. The computer will then go back and ask for the move again. Once the computer has accepted a move as valid, you cannot change it.

When moving one of your pieces back into play from the bar, enter "BAR" in response to the first prompt. If you are moving one of your pieces off the board at the end of the game, enter "REST" in response to the prompt "TO".

If you throw a double, you are required to make four sets of moves.

620-630
620-680

valid because no pieces are on the bar or off the inner table.

Set move distance variable.

Test that move distance corresponds to one of the dice throws. If White isn't bearing off, jump directly to 840 to test flag.

690-830

Check that, if player is bearing off with a dice throw greater than required, no White pieces are on higher point. Check that a dice throw exists to permit the required move, and set DD to this value ready for the next routine.

840-910

Check that a dice throw exists to permit the required move, and change the array values to register White's move if it's valid.

920-950

Check for a win by White and print appropriate messages. Stop program.

960-980

Check if any of Black's pieces have been taken and alter array if necessary. Loop for next move.

990

Go to Black's move.

1000-1020

Routine to display invalid move.

Computer's move

1030-1070

Subroutine to check whether the computer can start moving its pieces off the board (similar to routine for White above).

1080-1130,

1250-1300

Computer decides whether to make an ordinary move or move pieces off the board.

1140-1160

Remove piece from board with first move.

1310-1350

Remove piece from board with second move.

1170-1240

Display the move and change the array.

Check if Black has won and display appropriate messages.

1360-1460

Entry point to computer's move routine if White has been unable to move. This is checked and a jump made to the invalid message routine if necessary. Otherwise fall through.

1470-1580

Computer's throws calculated and displayed. Loop counter altered if doubles thrown.

1590

Check to see whether any of computer's pieces are on the bar. If so, go to the bar-clearing routine at line 3120.

1600-1620

Call subroutine to check if computer can bear off. Go to bearing-off routine at 1080 if so.

1630

Decide whether to play defensively or not (go to line 1670 if not).

1640-1660

Check if any pieces are vulnerable. Go to routine at 2010 if any are.

1670-1730

First move (attack white pieces). Check to see if a black piece can move from the point in question. If a white piece is available for taking on that spot, go to the 'take piece' routine at 2870. An identical routine for the second move is at lines 1870-1930.

1750-1800

First move (if no white pieces can be attacked). Check if a black piece can be moved legally and do so. An identical routine for the second move is at lines 1940-2000.

2010-2150

Routines for the saving of exposed pieces. Check to see if a white piece can be taken with either the first move (2020), or the second move (2050), or with both moves added together (2070). If a white piece can be taken in any of these ways, the appropriate action is taken. If no white piece is exposed,

a check is carried out to see if an ordinary move is possible for the piece (2100 and 2130). If one is found it is implemented.

Drawing the board

- 2160-2240 Plot in frame.
- 2250-2260 Print top and bottom of frame using inverse video characters.
- 2270-2600 Display pieces on board using PRINT AT. If more than five pieces are on a point, replace top piece with number of pieces.
- 2610-2740 If either player has pieces on the bar, display them at the side of the board.

Registering Black's Moves

- 2750-2860 Registering of move if no white piece has been taken (2750-2800 for the first move, 2810-2860 for the second). Moves displayed on screen by lines 2780 and 2840.
- 2870-3020 Registering of move if white piece has been taken (2870-2940 for the first move, 2950-3020 for the second). Moves displayed on screen by lines 2920 and 3000. These moves differ from the previous set because W(31) is incremented by one and the array position that the white piece occupied is decremented by one. The player is informed that a piece has been taken by the message "BAR".
- 3030-3110 This routine is used if the computer has used both its throws together to take a white piece.
- 3120-3150 If the computer has a piece or pieces on the bar, this routine decides the printout format to be used. Line 3250 is chosen for the first move, line 3370 for the second. If the computer is unable to move, line 3150 ensures that the appropriate message is printed once only.
- 3160 If the computer has thrown a double, this line sends the computer back to the beginning of the movement routine to make its second two moves.
- 3170 Displays the board with the new moves on it.
- 3190-3240 Waits for the player to press a key before continuing with the next throw of the dice. May be altered to a PAUSE statement for automatic play.
- 3250-3480 Register moves if the computer has brought a piece back into play from the bar (3250-3360 for the first move, 3370-3480 for the second). If a white piece has been taken too, the routines at 3330 and 3450 are called.

Should either you or the computer get more than five pieces on any point, a complication arises because of the restricted height of the ZX81 display. We got round this by replacing the top piece on the point with the number of pieces on the point (the photographs make this clear).

CONVERSIONS

Conversion to other, more sophisticated machines should prove no problem at all. The initial board position could be set up by using READ-DATA statements. CLEAR (line 10) may need a figure after it on some machines. If you use the PAUSE version, the delay could be obtained with a FOR-NEXT loop. RAND need not be used on some machines, but may be found in the form RANDOMIZE on others. CODE is normally found in the form ASC(), and a further complication is introduced by the non-standard ZX81 character set. On a machine using standard ASCII codes, the offset 37 in lines 390, 460, 1190, 2780, 2840, 2920, 3000, 3080, 3270, and 3390 would have to be changed to 64. RND is usually RND(0) or RND(1).

As far as the screen display goes, much better simulations of the board should be possible on machines like the Dragon 32, BBC and ZX Spectrum due to the higher resolution and colour. If you have a machine which doesn't support PRINT AT or a similar statement, you could adapt the system we used in The Valley with [HOME] and cursor movement strings.

3D MOVER

Creating a three-dimensional image on your 16K ZX81 is not as difficult as you might imagine.

I have been interested for some time in trying to get a program to RUN on the ZX81 which displayed a solid object rotating in space giving a three-dimensional effect.

The program, once typed in, requires a full five minutes RUNNING time to complete the POKEing of each of the six picture frames. The program will then automatically begin. The display is quite realistic — there is no screen flicker or jumping — and shows a rotating rectangle, spinning on a fixed axis. The rotational effect lasts for around 30 seconds and looks something like the illustration shown in figure 1.

SHAPES OF THINGS

The shape of the figure is easily altered by changing the co-ordinates, X() and Y() in lines 140 to 600. (You'll need to do this on plotting paper though.)

One restriction of the program is that only the top half (lines 0 to 10) can be used. When I first developed the program, I tried to use the whole screen but I ran out of memory (even with the 16K RAM Pack attached!).

Once you have the program entered into the machine, it should be SAVED before you attempt to RUN it. Once it has been RUN, any new instructions

have to be typed in 'blind' as the PRINT position has been moved down below line 23 of the screen. If you want to re-RUN the program, you should type in 'GOTO 1000'; this will also have to be done 'blind'.

As a final point, the insertion of a '£' sign at lines 630 and 650 is to end each frame with a code signal for the operating machine code to recognise that end of frame, and the end of the last (the sixth) frame.

Initialisation to repeat cycle 255 times; can be shortened by POKEing smaller numbers to address 30001.

Start of display.
Set address of first data bit of first frame.

Prints it.
Next screen position.
Next data bit.

Compare it to '£'.
If not '£', print it and continue with next data. Next data bit.

Compare it to '£'.
If it is '£', return to start and repeat the cycle. If not '£', delay after printing first frame. Delay — POKEing larger number than two at address 30029 will reduce the speed of rotation.

GO TO screen and start again.

The machine code part of the listing.

Fig. 1.

BASIC NOTES

Here is a breakdown of the BASIC part of the listing:

Lines 140-600

SUB 4010

SUB 1500

Lines 660-800

SUB 4070

Lines 1010-1060

Initialisation — co-ordinates of the corners of each wire frame (there are six frames altogether).

Enters the operating machine code starting at address 30000 from A\$.

Leaves A\$ as an empty string.

SUB 2500 and SUB 3000. Prints the picture of each of the six frames in turn.

Convert the picture frame into Hex code and store code in a character string (A\$).

POKEs the Hex code into memory starting at the address after the operating code (address 30042 and leaves A\$ as an empty string ready for the next frame.

Calls up the display with RAND USR 30000.

Listing for the program, 3-D Mover.

JUST ANOTHER BRICK

Did anyone ever say to you "Gee you're a real brick"? Did it make you see red? Well now give vent to your anger... Demolish walls and draw lines round your ZX81.

The wall is closing in on you. There's no escape. Can you destroy it before it destroys you? The answer, quite simply, is NO. The wall is endless. Your 'V' is moved rapidly from left to right at the top of the screen. The wall scrolls up towards you. Your only chance is to hurl yourself at the wall in the hope of dislodging some bricks.

The game is fast for a BASIC program. This is because characters are POKEd into the display file — much faster than PRINT AT, especially when dealing with numbers. Your score is POKEd on the bottom line of the screen, making use of the full 24 lines. It is necessary to use these lines as they are not moved up when SCROLL is used.

The speed of the wall moving can be made faster/slower by changing the length of the loop in line 250. You could even introduce another variable which makes the game faster as it goes along.

VARIABLES USED

P = Display file for poking the

'V'.

W = Display file for poking your score.

S = Score.

H = High Score.

X = General purpose loops

Y = Position for the 'V'.

C = Counter for number of bricks you have hit.

D = Number of bricks to be knocked out.

Z = Part of score being poked.

F = Vertical position for 'V' when being fired at the wall.

A\$ = String array for printing "SPLAT" in big letters.

X\$ = Score string to be poked on line 24.

SURROUND

The idea of this game is to trap your opponent, the ZX81, by making it bump into something. The ZX81 will try and trap you, using a rare blend of cunning and intelligence.

Despite this, you'll probably find you know what its next move is going to be after playing it a few times. Then you can get to work, and modify the computer's strategy by changing lines 540 to 570.

The first player to win five games wins the round.

Wall listings.

NUMBER TUMBLER

Written for the unexpanded ZX81, this program is a version of the old favourite 'Fruit machine'. However, in this program, instead of designs, bars, apples, etc, you use numbers.

At the beginning of the game, you have 10 points in credit. These are displayed on a small score table on the screen. When you touch and key, the game starts and three numbers are displayed. If you get any two numbers the same beside each other, you are awarded

three points; if you get all three numbers the same you will be awarded the maximum of six points. Should you get the number 5 in the first position, you get a bonus score of two points.

The number of credit points you have decreases by one point for each turn. The game ends when your credit rating reaches zero. As there is limited memory left over, I was unable to include a 'hold' feature, but I'm sure that those of you with extra memory will be able to write a quick routine.

**Is your number up?
Find out with this little
program.**

```

2  LET CR=VAL" 10"
35 LET CR=CR - VAL "1"
37 PRINT "SCORE TABLE"
38 PRINT
40 PRINT "5 - - = 2
   POINTS"
50 PRINT "2" EQUAL
   NUMBERS TOGETHER
   = 3 POINTS"
60 PRINT "ALL THREE THE
   SAME = 6 POINTS"
80 PRINT
85 PRINT "CREDITS = ";CR
86 LET X=INT(RND * VAL
   "- *")
87 LET Y=INT(RND * VAL
   "10")
88 LET Z=INT(RND * VAL
   "10")
90 PRINT
94 PRINT " ";X;" ";Y;
   " ";Z;" "
96 PRINT
98 IF X=VAL "5" AND
   Y = X THEN LET
   CR=CR+VAL"2"
99 IF X=Y AND Y=Z THEN
   LET
   CR=CR+VAL"6"
100 IF X=Y AND Z = X OR
   X = Y AND Y=Z THEN
   LET CR=CR+VAL"3"
105 IF CR=PI - PI THEN
   GOTO VAL"130"
107 PRINT "TOUCH ANY
   KEY"
110 PAUSE 4E4
115 CLS
120 GOTO VAL "35"
130 PRINT "FINISHED - NO
   CREDITS LEFT"

```

Note that the message 'Score TABLE' in line 37 should be in inverse video for maximum effect.

3D CUBES

Here is a way to get representations of 3-D cubes on the ZX81. The method is explained and uses a 'selfmade television screen worksheet'.

Here's the way my program works. All you need is a 16K ZX81, a worksheet like the one I've shown here, and a little patience. Although it takes a while to type the program into your ZX81, the results seem pretty good to me.

HOW IT RUNS

Lines 5 to 65 ask for the four co-ordinates of the angular points of the upper surface of the cube. You only have to input the first co-ordinate of the first angular point (E;F), then press NEWLINE (of course), and then input the second co-ordinate, i.e. F Mind the right

order of the angular points!! Look first of all the television screen worksheet to know where (E;F), (G;H), (I;J), (K;L) are situated, and don't change the order.

Line 70 asks you to give the height of the cube. Don't make M too high otherwise the cube will 'run out of the screen'. A height of about 10 to 25 is recommended. Of course, it all depends upon the position of the chosen co-ordinates of the angular points.

Lines 85 to 180 print the first 'horizontal' edge (see the second example) of the upper surface of the cube. In the first

example the first line of the upper surface at the left will be printed.

Lines 185 to 280 print the second 'horizontal' edge.

Lines 285 to 340 print the four vertical edges of the cube.

Lines 345 to 440 will print the first horizontal edge of the base (see example two) or the first line in example one.

Lines 445 to 540 do the same as lines 345 to 440. Then the second line will be printed.

Lines 545 to 700 print the four oblique lines of the cube.

As you can see the program is rather easy to understand because it's all BASIC.

Four of the best on BBC

PROGRAMMING THE BBC MICRO

Edited by Peter Williams

"An excellent review of the potential of the BBC Micro... way ahead of its rivals" BBC Micro User

To help you program your BBC Micro. Practical programming points and BBC BASIC as applied to graphics, words, numbers and sound are covered as well as machine code, hex, assembly language, interfacing, file handling and the hardware.

Softcover

176 pages

£6.95

6502 MACHINE CODE FOR BEGINNERS

A P Stephenson

BASIC is a simple language to learn but it takes up a lot of memory space and is slow to run. Machine code is more complex but it does have considerable benefits and this book shows you how to take advantage of them.

Softcover

176 pages

£5.95

EXPLOITING BBC BASIC

A P Stephenson and D J Stephenson

A book for BBC Micro users who have mastered the first stages of programming and who now want to exploit their machine to the full.

Two cassettes also available containing some of the longer programs.

Softcover

GRAND PRIX DRIVER

Strap yourself in and
prepare yourself for the
race of your life!

This program, occupying almost 15K, simulates a 10 lap race around a Grand Prix circuit involving all the thrills and spills of the real thing!

Racing around the track clockwise, you move your car using the '5' key to move to the left, the '8' key to move right, the '7' key to move up and the '6' key to move down.

A GRAND TIME

You'll have to watch out for various obstacles on the track, because if you hit them they will cause you to incur time penalties. If you accidentally hit the outer barrier of the track, your car will crash and you are out of the race instantly. Also, if you have an accident in the pits, it is supposed your car will

be blown to pieces. Should you crash into the inner barrier, your car will automatically be towed to the pits where it will undergo extensive repairs which will cause you to lose a lap. However, if you manage to crash your car into the barrier again, your car will burst into flames and you are placed out of the race for good!

You begin the race with a

full tank of petrol — 800 litres — which should be enough for about seven to eight laps if you drive carefully. After you have completed seven laps you may enter the pits and be re-fuelled with 50 litres of petrol. You can drive through the pits before this stage of the race, but you will not receive any extra fuel.

When you drive into the pits you must take care as there is usually a lot of oil carelessly strewn around which makes skidding very easy to do.

NO CHEATING

Various routines have been put in making it very hard for you

to cheat in this game. You are not allowed to drive through the pits backwards thus re-fuelling more than once a lap, and you may not drive backwards and forwards across the start/finish line.

Various indicators, such as 'fuel remaining' and 'lap number', are displayed and updated each time you cross the start/finish line (or when you crash) giving you some idea of your progress throughout the game.

EQUATION SOLVER

We show you how to solve equations on the ZX81 using the bisection method.

Suppose that you want to solve an equation of the form $f(x) = 0$, such as:

$$y = f(x) = x^3 + 3x^2 - 10x - 15$$

The roots of this equation are the values of x for which $y = 0$. You can find roughly where they occur from a sketch graph (Fig. 1) which shows that the curve cuts the x axis at three places. One is between $x = -5$ and $x = -4$, another between $x = -1$ and $x = 0$, and the third is between $x = 2$ and $x = 3$.

You could find this same information by tabulating the values of $y = f(x)$ for a range of values between, say, -10 and $+10$ (Fig. 2). Where the sign changes from plus to minus, or vice versa, is the interval in which you could expect to find a root. The table shows that there are again the three intervals $(-5, -4)$, $(-1, 0)$ and $(2, 3)$ which need to be studied in more detail.

The bisection method takes each interval in turn, divides it into two equal parts, and decides in which half the root is to be found. It then divides that half into two equal parts and repeats the process. This iteration continues until the size of the portion so formed is smaller than the specified error, at which point it gives the mid-point of the portion as the root of the equation. It is here that the graph crosses the x axis and changes sign.

ADVANTAGES AND DISADVANTAGES

Unless you tabulate the function over a very wide range, you cannot be sure of finding all the roots of an equation. Nor can you find any roots that might be complex numbers, such as the solution to the equation $y =$

GRAPH OF $y = x^3 + 3x^2 - 10x - 15$

$x^2 + 1$, for its graph does not even cross the x axis (Fig. 3). However, you can find the solutions to whatever accuracy you like given sufficient iterations and, as the method does not suffer from instability, it always converges to the required answer.

BETWEEN THE LINES

The program will run with about $4\frac{1}{2}$ K RAM. The following describes the structure of the program.

Lines 10-110 set up the default values of the parameters. the equation to be solved is held as A\$.

Lines 200-360 print the menu and choose the selected subroutine.

Lines 1000-1030 allow the equation to be entered or changed. To prevent program execution stopping with the report code A, powers of x such

as x^3 should be entered as $x*x*x$, and so on. Lines 2000-2080 specify the interval in which you are searching for a root. Lines 3000-3040 ask for the number values that you want to tabulate. Lines 4000-4090 tabulate the function over the range set by option 2. If a change of sign occurs between the lowest and highest points of the range, the bisection method can be used. If two or more changes of sign occur, the interval set by option 2 should be reduced to include just one such sign change. if no change of sign occurs, then a wider interval could be tried. Lines 5000-5040 allow the maximum permitted error in the answer to be set. The smaller this is made, the longer it will take and the more iterations will be needed to reach the solution. In fact the error depends on $1/2^n$, where n is the number of

iterations.

Lines 6000-6230 carry out the actual bisection process, letting the user know if an incorrect interval has been set by option 2.

Lines 7000-7050 list the current values of all parameters, including the equation itself.

Lines 9000-9070 wait for a user to specify either a return to the menu or a printout of screen contents. The program will run as it is even if no printer is available.

HOW TO USE THE PROGRAM

When first run, choose option 1 and enter test equation $x^3 + 3x^2 - 10x - 5$ in the form:

$$x*x*x + 3*x*x - 10*x - 5$$

Then choose option 2 and specify the interval from -10 to $+10$. Option 3 should be used to ask for 20 tabulation points. Option 4 will list the values of the equation at these 20 points, and will also tell you what to do when the screen fills up. The table should look like that in Fig. 1. Three changes of sign are found, so we call up option

2 again and enter the interval $(-5, -4)$.

Next, we choose an error of less than 0.00001 using option 5. Option 6 calculates the root in our chosen interval as -4.84946 . You can then return to option 2 to set the other two intervals in which there is a root of the equation.

Note that the test equation is

a cubic, for which there can only be three roots. However, any polynomial or trigonometric equation can be entered, for example, $\sin(x) + \tan(x) - 3x^2 + 4x$.

With practice, this becomes an effective and reliable way of solving all sorts of equations — especially recommended for maths homework!

TABLE OF VALUES BETWEEN -10 AND 10 OF $X*X*X+3*X*X-10*X-5$

MINEFIELD

You must really watch your step in this program!

All you have to do in this game for your ZX81 is to establish a safe route through a minefield you know to be planted with 13 deadly mines.

TO THE DEATH

Your mission is of the suicide

variety and of the utmost importance — vital to the war effort in the war you have happened upon. And that is why to a certain degree your lives are expendable. You command three men and their task is to beat a path through the minefield — at least one of your men must get through as

three explosions will alert the enemy that someone is trying to cross their defences and your mission will be over.

You move your men across using the cursor keys. No clues or hints are given as to where the mines have been hidden — you must manoeuvre your men purely on instinct. Good luck!

Here follows a brief breakdown of the program, line by line:

- Lines 5-35 Set up the variables used throughout the program.
- Lines 40-55 Provide the geographical parameters of the minefield in which to confine the random deployment of mines.
- Lines 60-75 The random deployment of the mines in the minefield.
- Lines 80-120 The minefield screen display.
- Lines 125-190 Control the movement of the men. (Lines 155-170 compare the men's movements with the 13 mine positions.)
- Lines 195-225 Control the end of the game and the re-start if required.
- Lines 1000-1030 Contain the code for the word 'START' to flash on the screen at the start of the game.
- Lines 2000-2080 Contain the routine for what happens, explosions, etc, when one of your characters steps on one of the hidden mines.
- Lines 3000-3030 Contain the code for the word 'HOME' to flash on the screen when you have managed to cross the minefield with one of your characters.

DEATH RACE

The object of this program is to try and manoeuvre your car (represented by an asterisk) across the screen as many times as possible. The trouble is that your opponents have set up a scheme to try and stop you in your quest by setting up a series of road blocks.

Trouble is that your opponents haven't had much time to set up the roadblocks so some of them are not as good as others. The ineffective roadblocks are represented by grey blocks (made up from the graphics character on the 'H' key) and you get points for smashing through these. But

you must take care of the black roadblocks.

To move around the screen, you use the 'I' key to move the asterisk up and the 'A' key to move the asterisk down. Points are scored each time you cross the screen. Every fourth time you manage to cross the screen you will be awarded an extra life, but watch out for the black roadblocks as you will lose a life each time you hit one!

TOO EASY?

To alter the difficulty of the game, try changing the '5' in lines 210 and 220. Also, if you want to give yourself more (or

Drive your ZX81 to the limit.

less) lives, alter the '5' in line 90. The '4' in line 1030 controls the number of times you have to cross the screen to gain an extra life.

Should you find the game too slow, then try duplicating lines 260, 270 and 280 as lines 8000, 8010 and 8020. Then add the following lines:

```
260 IF PEEK B < > 0 THEN
GOTO 8000
8030 GOTO 290
```

and remove lines 270 and 280.

To SAVE the program, press the Break key, start the tape recorder and type RUN 7000, and press Newline.

TOWERS OF HANOI

The ZX81 solution to this age-old puzzler.

This program will help you solve the Towers of Hanoi problem. This involves a number of rings of different sizes which are stacked on Tower 1 in a similar way to that shown in Fig. 1. The idea of the problem is to eventually stack the rings on Tower 2 or Tower 3 so that at no time does a larger ring rest on a smaller one.

A BIT STEEP?

The driving force of the program is the recursive subroutine (one which calls itself) at lines 50 to 104. The program enters the subroutine with N (the number of rings in play) and breaks out at line 82 with P (the tower number — 1, 2 or 3) from which the ring is to move, Q (the number of the 'goto' tower) and N (one less than the number of the moving ring — ring 1 being the smallest). After display of the move, the routine is re-entered at line 84 for the next instruction and then circulates between lines 70 to 104 until the problem is solved. The program finally RETURNS to line 60 to

show the number of moves made (always $2^N - 1$, where N is the number of rings) and to wait for key 'P' at line 64.

The recursive subroutine can be modified to run on its own. First, you should add the following line:

```
49 INPUT N
```

where N represents the number of rings. Then, replace lines 60 to 68 with:

```
60 STOP
```

Finally, replace lines 82 to 84 with the following line:

```
82 PRINT "RING";  
N+1;"FROM TOWER";P;" TO  
TOWER"; Q
```

Then, RUN 49 and enter your value for N.

The action of the routine can be followed through, for N=3 for example, if it is remembered that GOSUB puts its RETURN address (the following line) onto the GOSUB stack and each RETURN removes an address (last in — first out) and goes to it.

START HERE

For newcomers to the ZX81, the following notes may prove of interest.

Lines 40 to 46 produce a number of nine character rings, all PRINTed at column zero; their middle characters from the centre of Tower 1 at column four. The tops of the towers (usually invisible!) are all on screen line five.

At lines 108 to 124, the P and Q values (1, 2 or 3) from line 82 are converted to 0, 9 or 18, and are assigned to GF and GT as the PRINT AT column numbers for the 'go from' and 'goto' towers respectively.

The character, R\$(N+1), of the ring to be moved is given by N from line 82, but its line number and the height to which it must be raised are found by PEEKing the towers. This requires the display file reference address, D, which is the central top of Tower 1. (Try adding a line 49 POKE D,23.) The D file addresses of the tops of Towers 2 and 3 are therefore D+9 and D+18, so a ring at three lines below the top of Tower 2 will have its centre at addresses D+9+99 and will be found by PEEK (D+T), where T has the value of 108. In that case, the subroutine at lines 166 to 174 will RETURN to lines 114 or 124 with TT=9 and T=108 and assign value 8 to the PRINT AT line number variable X or Y. The difference between eight and three is explained by the tower tops being on screen line five.

The 'other' tower need not be PEEKed; the line number of its upper ring, Z, can be calculated because the total of lines from the tower tops to the upper rings on all three towers

is always twice the number of rings in play. Therefore, $X - 5 + Y - 5 + Z - 5 = 2 \times N1$ (check out lines 34 and 128).

HIGH TIMES

It will be seen that X, Y and Z are inverse measures of the heights of the piles of rings on the 'go from', 'goto' and other tower respectively.

$ABS(GF - GT) = 18$ means that the 'go from' and 'goto' towers are 18 column apart, so that the other tower is between them. If the height of its pile is greater than that of the GOTO tower, ie Z is less than Y, then the lift (if any) of the moving ring must be

determined by Z and not Y — hence lines 134 to 136.

Program with subroutines may suffer from lack of memory if they are frequently interrupted before all the GOSUBs have returned; useless return addresses accumulate in the GOSUB stack, causing it to go down in memory which may be required by the program itself. The effect of this is perpetuated when the program is SAVED.

In this program, the stack can be cleared in the following way. First add the following line:

59 Run 81

Then, add the following two lines:

```
61 PRINT AT 14,0;PEEK
    16386+256*PEEK
    16387
```

```
81 PRINT AT 14,0;PEEK
    16386+256*PEEK
    16387
```

Finally, change line 82 to read:

82 RETURN

Repeat the command, RETURN, until the error report shows T/82. Lines 61 and 81 are optional — they show the changes of the addresses of the GOSUB stack (it is 32764 when cleared). Don't forget to remove line 59 and restore line 82 before trying the game again though!

The listing for the program, Towers of Hanoi.

```

SHEEPDOG TRIALS

Round up your sheep
but don't get penned in!

The object of this game is to round up a number of sheep in the shortest possible time. You are given the choice of how many sheep (between one and six) you would like to round up; one sheep is fairly easy, but if you choose to round up six sheep you will find it very time consuming as they keep wandering out of the pen as others are being rounded up.

You move the sheep by placing the dog near to the sheep using the cursor keys, so that it will move directly away from the dog. However, if you move too close to the sheep, you may find that the sheep will panic and are liable to move in an unpredictable direction.

The dog is allowed three moves between sheep moves; this can be increased if required by changing line 710.

The game ends when the dog has rounded up the sheep and is standing guard at the gate of the pen and the dog's three moves have been completed. At any stage of the game, neither the dog or sheep are allowed to jump the fence or wall of the pen.

IT'S A DOG'S LIFE

The dog and sheep are POKEd

onto the screen and the previous positions of the characters are blanked by POKEing with zero. The POKE numbers are calculated as offsets using the number held in the system variable D-FILE as a base point.

The checks on the relationship between sheep and

dog are made in terms of x and y co-ordinates, so routines to convert to these are included; they are located at the beginning of the program to speed up the operation. The routine to generate random sheep moves is also placed at the beginning of the program for the same reason. The

positions of the sheep in terms of the POKE offsets are held in the array, S(NS).

The timer, which is initialised in lines 707 to 709 and updated by the subroutine at line 2010, makes use of the FRAMES system variable. Lines 9000 and 9010 are the usual ZX81 self-RUN routine.

The listing for Sheepdog Trial.

USER CHARACTER SET

Similar in nature to the user definable graphics program by Chris Callender which appeared in the August/September issue of *ZX Computing*, this program is rather more flexible in that it will store a character set of up to 99 characters and enable them to be LPRINTed simply by entering a string (X\$).

Once you have entered the program, you will be greeted with the prompt:

NOW ENTER THE CODES FOR THE SPECTRUM CHARACTER SET

Simply type in the codes given for the lower case characters (like on the Spectrum), and these will be placed in the array, U.

You will now be given the prompt:

ENTER TEXT TO BE LPRINTED USING NEW CHARACTER SET

At this stage, you simply enter what you would like to be printed in upper and lower case.

Any letters you enter as normal video will be printed in

lower case. Any letters entered as inverse video will be printed as upper case. Numbers entered as inverse video will actually be printed as normal video numbers, whereas if any numbers are entered as normal video, they will be printed as the extra characters which have been defined for them.

EXTRA, EXTRA

If you have entered your own characters, having answered 'Y' to the prompt:

DO YOU WANT TO ENTER YOUR OWN USER-DEFINED CHARACTERS? (Y OR N)

then they can be obtained by typing in the graphics corresponding to the Sinclair codes 1 to 10 (for details check out Appendix A of the Sinclair ZX81 manual). For example, CHR\$ 1 corresponds to the first user-definable graphic.

Character definition should only be attempted if you understand the way that a character is made up from binary numbers (eight for each character). These numbers must then be translated into decimal

Print upper and lower case characters with your ZX81.

to be typed in to the program. The extra graphics characters, along with the number that has to be entered to produce them is shown in Fig. 1.

LINE BY LINE

Before typing in or re-LOADing this program from tape, it is important that you enter the following two lines (each followed by Newline) as direct commands:

```
POKE 16389,124
NEW
```

in order to reserve space above RAMtop for the LPRINT routine which is copied out from the ROM in lines 10 to 50.

Here follows a brief breakdown of the structure of the program.

Lines 100 to 170 copy from the ROM into the array S, all the codes for Sinclair's characters, from 'O' to 'Z' (normal video). Lines 200 to 270 copy from the ROM into the array U, all the extra Sinclair symbols, such as '!', '!', etc. These will then be obtainable directly when the program is in use.

Lines 300 to 370 allow for the user to enter the codes for the lower case characters into the array U. (These codes are shown in Fig. 1). Every other line of this printout has the codes to be entered, separated by '/' to represent Newline, and above each set of codes is the number that should appear at the top of the screen when these codes are to be entered (and represent the codes' positions in the array U).

Lines 500 to 700 allow you to enter wherever you wish to be printed using the new character

set, and then looks up the codes for these characters in the appropriate arrays, mapping them into the array A, for LPRINTing using the subroutine from Sinclair's printer manual (lines 9990 to 9999). When all

the arrays have been entered, lines 100 to 500 can be deleted. Line 1 should then be changed to read 1 SAVE "Characters". Connect up your cassette, start it recording, then enter GOTO 1 as a direct command. Do not

use RUN or the arrays will be wiped. Make sure that all DIM statements have been erased. The program, will begin straight away, which avoids the danger of the user typing RUN instead of GOTO to begin.

Fig. 1. The codes for the lower case characters - to be entered into the array, u.

THE SHARP END

Execution is a graphic variation on the hangman game. The computer chooses a word randomly from its vocabulary, and you have to guess what the word is, by entering letters one at a time.

You're allowed 10 incorrect guesses before the blade on the guillotine does its job. There is no need to press NEWLINE when entering guesses.

Before you run the program the first time, enter DIM D\$(30,10) as a direct command, then start it with GOTO 1 (not RUN). Then, you'll be asked to enter 30 words, one at a time. For subsequent runs, start with GOTO 5, and your vocabulary will be safe. Enter "N" if you do not want another game at the end. SAVE the program by entering GOTO 390. Note that the inverse E in line 390 should be entered as an ordinary E.

ANAGRAMS

The ZX81 randomly selects and scrambles a word. You must repeatedly enter what you think is the correct word, and the computer will underline those letters which are in the correct position.

You have a maximum number of attempts before the computer stops you and reveals the word. You use "N" if you don't want another game, or just press NEWLINE/ENTER if you do.

Entering the initial vocabulary, and the subsequent changing of it, is the same as in

Execution. Save the program by entering GOTO 340, and restart the program without losing your vocabulary, by entering GOTO 10. You'll need to set up an array, by entering DIM D\$(30,10) in the direct mode before you begin, then start with GOTO 1.

It takes some time to scramble a word, so don't be surprised if nothing happens for the first few seconds of the game.

CRASHER

Nothing to do with some computers' habits of blanking out! You are drifting in space, the object being to clear up as much debris as you can, particularly those with a high CODE value. The debris is valued according to the code of the character of debris. The letters score highest, then numbers and so on. Ignore inverse characters if they appear for they do not score because they've been affected by solar radiation and mutated to their inverse form, so are not worth anything. The keys 5 and 8 steer you left and right in the direction of the arrows on the keys. You score when the debris is directly ahead of you on screen so you 'crash' into it. The position of your spaceship on screen is set by X (horizontal position) and Y (vertical position). They are initially set by lines 10 and 20 to a position at about the middle of the playing area of the screen. The variable S records your score

Execution and Anagrams are two great word games from Paul for the 16K ZX81, but if you have only 1K try Crasher from Dilwyn.

and is set to 0 at the start of the game by line 30. F is the variable that controls the duration of the game — it does not count in any particular unit but is convenient way of controlling the length of the game. The time is clocked up in line 50, one unit of space-time at a time(!) The statement LET F=F+ — may confuse you a little since it is hard to imagine F being equal to F+1.

TRUTH

It actually means add 1 to the old value of F to make the new value. Line 60 is rather complicated. It determines where the character is PRINTed, which character is PRINTed and whether it's an inverse character. Let us look at the position first. The character is placed at the bottom of the playing area (the Y co-ordinate is set at 20 and C co-ordinate to a value from 0 to 19 by the random number expression. The expression after the semi-colon generates a character at random from the number generated in brackets after CHR\$. The number generated is a random number from 1 to 63. The following expression may look rather strange, but all it does is determine whether to add 0 or 128 to this number (ie determine whether the character generated is inverse or not. It is a special use of the function AND. What it does is look at the following expression, add 0 to the value if it is not true, or the value before AND if it is true, so that 128 is added to the random number only if RND is less than .2. This makes it roughly a one in five chance of the character being an inverse, non-scoring character. The statement after this erases the old position of the V before it is scrolled up the screen by line

70. This ensures the V is not PRINTed anywhere other than the middle of the screen. Line 80 checks the keyboard to see whether you're steering to the left, right, or keeping it stationary, and changes the value of X accordingly.

PRINTING AND RUSHING

The V is PRINTed in its new position in line 90. You can see how the effect given is that the

spaceship (V) remains stationary while space seems to rush past. The second part of line 90 moves the PRINT position to immediately ahead of the position of the spaceship. Therefore we may find what is immediately in front of the spaceship by means of the line 100, which finds the CODE of the character stored at that memory location by PEEKing the address held in the system variables 16398 and 16399. Line 110 checks to see if this

character ahead of the spaceship by means of the line (ie it has a CODE of less than 64 rather than less than 128 as you might expect from an inverse character detector). This would permit CHR\$ 118 NEWLINE markers that SCROLL might push up the screen. You may like to add this line which will stop the program if you hit a radiation-mutated piece of debris:

115 IF P > 127 THEN STOP

MUNCHER II

Monsters will try to catch you while you're quietly going dotty!

In the June/July issue of *ZX Computing*, 1983, appeared the program Muncher — a Spectrum version of the popular arcade game of the dot-eating kind. For all those of you with 16K ZX81s the author, Robert Turner, has converted the program for you.

For those not familiar with this 'infamous' game, you control a small character, an arrow which travels around a small maze eating dots as it goes. That's not quite the end of the story though! As in all good arcade games there should be omnipresent monsters — and this game is no exception. You are chased around the maze by two monsters eager to halt your progress.

However, all is not lost as there are power pills situated in the corners of the maze which, when consumed, give your character the ability to destroy the monsters. You'll know when the monsters are vulnerable as they develop 'eyes'. When you have eaten a power pill, don't hang around as the monsters try to escape.

You score one point each

time you eat a dot, and power pills and monsters are worth 10 points. Every now and then a '£' sign will appear under the monster's den and this too is worth 10 points if consumed.

VARIABLES

The variables used in the program, Muncher II, are as follows:

S — Score

HS — High Score

T — The score when the screen has been cleared.

B\$ — The variable which stores the maze.

COUNT — If this variable is less than 30 the monsters can be eaten. If it is more than 30 the

monsters can eat your character.

LIVES — The number of lives you have left.

Y and X — The position of your character.

A\$ — The shape of your character.

GX and GY — The position of the first monster.

GX1 and GY1 — The position of the second monster.

C — This variable controls the movement of the monster. If C = -1 then the monster moves away from your character, if C = 1 then the monster chases you.

D\$ — The shape under the first monster.

E\$ — The shape under the second monster.

A — The skill level.

N — Allotted for general use.

So, don't just sit there — type in the program and watch out for the monsters!

THE RIGHT CHORD

Having difficulty getting your fingers round those tricky guitar chords? Bring you ZX81 into play.

When RUN, this program draws a simulation of a guitar neck and asks the user to input a number corresponding to the particular chord you wish to see on the screen.

GETTING IN TUNE...

The program asks the user to input a number from one to ten and then the chord corresponding to the number will be displayed with the relevant finger positions. The chord name is displayed in a box beside the diagram and the program then waits for a further input.

You could add two more chords to the published program by changing line 82 to read:

```
82 IF C<1 OR C>12 THEN
GOTO 80
```

and enter the co-ordinates for the new chords in the subroutines at lines 5500 and 6000. Then, you would have to alter the menu in line 7065. The chords included in the program as it stands are C, D, E, F, G, A, Dm, Em, Am, and G7.

Now if only someone could write a program to tune the guitar...

ENEMY SATELLITE

Don't let the enemy get your secrets.

Written for the unexpanded ZX81, the object of the game is to shoot the satellites out of the sky before they can relay information on your military bases back to the enemy.

As the enemy satellites traverse across the top of the screen, it is your job to move the ground to air missile launcher until you can get a good shot at the enemy device. Movement of the missile launcher is achieved by pressing the '5' key to go left and the '8' key to move right. Key 'O' is used to launch a missile at the satellite.

Should a satellite reach the

far left-hand side of the screen, it is assumed that the device has escaped destruction and has thus relayed all of the secret data on your military establishments. This is achieved in line 520 with the 'Q', and an error 2 message denotes the end of the game.

To hit a satellite, you must aim for the 'O' character of the device. if you do manage to destroy the satellite, line 160 causes an explosion to be displayed: this is followed by a PAUSE statement causing the screen to blink (just to add a touch of realism). When the game finishes, your score is displayed.

```

ON TARGET

Two great programs —
Target and Missile
Launcher.

When RUN, Target displays a target and a randomly placed star near the centre of the screen. You must then, using the 'N' key to move left and the 'M' key to move right, position the target so that the star is in the middle of it. Pressing the 'X' key will then fire at the star.

Confirmation of a hit on the star is given by the star turning to inverse video. The program ends if you fail to hit a star.

You set the difficulty of the game yourself at the beginning of the game; if you input a value below 15, the game is very hard indeed! The difficulty is calculated in the FOR...TO loop in line 50.

MISSILE LAUNCHER

In this program, you control a ground-based missile launcher with which you can fire missiles at oncoming alien attackers.

You can move your missile launcher using the 'N' key to go right and the 'M' key to go left. The 'Z' key is used to launch the missile. You can cheat by holding the 'Z' key down all the time as you move, but this will show up at the end of the game when the number of shots you took is displayed.

The game can be altered so that the missile rises at a faster rate. This is done by changing line 150 to read:

```
150 IF B <= 19 THEN LET
    B=B-2
```

If you make this change, you should also alter line 70 to read:

```
70 IF B <= 0 THEN LET
    B=20
```

"Run more than ten tasks on a ZX81-FORTH ROM?"

Sure! More than 10 tasks simultaneously and, in some cases, up to 300 times faster! That's what replacing the basic ROM with the new FORTH does for the ZX81 — and more!

The brains behind the breakthrough belong to David Husband, and he's building Skywave Software on the strength of it. Already orders are flooding in and it's easy to see why.

The ZX81-FORTH ROM gives you a totally new system. In addition to multi-tasking and split screen window capability, you can also edit a program while three or four others are executing, schedule tasks to run from 50 times a second to once a year, and with a further modification switch between FORTH and BASIC whenever you like.

The ZX81-FORTH ROM gives you a normal keyboard with a 64 character buffer and repeat, it supports the 16k, 32k, 64k RAM packs, it is fig-FORTH compatible and it supports the ZX printer.

The price, too, is almost unbelievable. As a "fit it yourself Epröm", complete with manual, it's just £25+VAT. Add £2 p&p UK (£5 Europe, £10 outside Europe) and send your order to the address below.

~~50 games for the Sinclair Spectrum, 16/48K.~~
~~There are fifty super high quality games on one~~
~~tape!!~~

STOP PRESS:

There are now sixty games on this fantastic compilation, yes 60 super high resolution arcade games that you will have hours and hours of enjoyment from, guaranteed!!!

60 of the best games around including: Pacman, Invaders, Frogger, Fruit Machine, Defender, Lunar Lander, Pontoon, plus much more!! All on one tape for only £9.95.

50 games for the ZX81 — £6.99. An amazing simulation of the sidewinder arcade fruit machine, features include random holds and nudges, flip-winding reels to a winning line. Visually stunning graphics to 'state of the art' machine code, true arcade sound effects.
Introductory price £5.50.

ONLY AVAILABLE BY MAIL ORDER FROM:

ANCO SOFTWARE ... THE ULTIMATE EXPERIENCE

It's easy to complain about an advertisement. Once you know how.

One of the ways we keep a check on the advertising that appears in the press, on posters and in the cinema is by responding to consumers' complaints.

Any complaint sent to us is considered carefully and, if there's a case to answer, a full investigation is made.

If you think you've got good reason to complain about an advertisement, send off for a copy of our free leaflet.

It will tell you all you need to know to help us process your complaint as quickly as possible. ✓

The Advertising Standards Authority.
If an advertisement is wrong, we're here to put it right.

ASA Ltd, Dept 1 Brook House,
Torrington Place, London WC1E 7HN

This space is donated in the interests of high standards of advertising.

SMAUG'S LAIR

Can you destroy the dragon's lair?

You are the Gunner Captain on a mission to destroy the dragon's castle.

You have five cannon and 12 cannonballs at your disposal . . . but . . . beware . . . the sound of your guns will wake the dragon. When he flies, time stands still and although he has poor eyesight, he will breathe fire and try to destroy all of your weapons. If he does . . . *run for your life!!!*

To dislodge the most bricks, hit the castle as high as you can by carefully choosing how much gunpowder to use and what angle to set the cannon at. If 6,000 bricks fall then the castle is in ruins and Smaug must seek a new wormhole. Good luck!!!

CANNON AND BALL

When you first RUN this program you are asked if you require instructions in the usual way. If you reply 'yes' (Y) you are given a brief introduction to the program to get the adrenalin up.

Then, the 'Battle Status' screen is shown and is returned to throughout the game. You are shown the current scores, and the castle will be demolished in proportion to the number of bricks you have knocked out. At the top of the screen, you see how far the computer has set the cannon from the castle ready for your first shot (this is random between 500 and 2,300 metres). You are then invited to enter the size of the gunpowder charge (25 to 35lbs) and what angle of elevation you wish the cannon to be set to (0 to 89 degrees).

Should the cannonball reach its target (the castle is 400

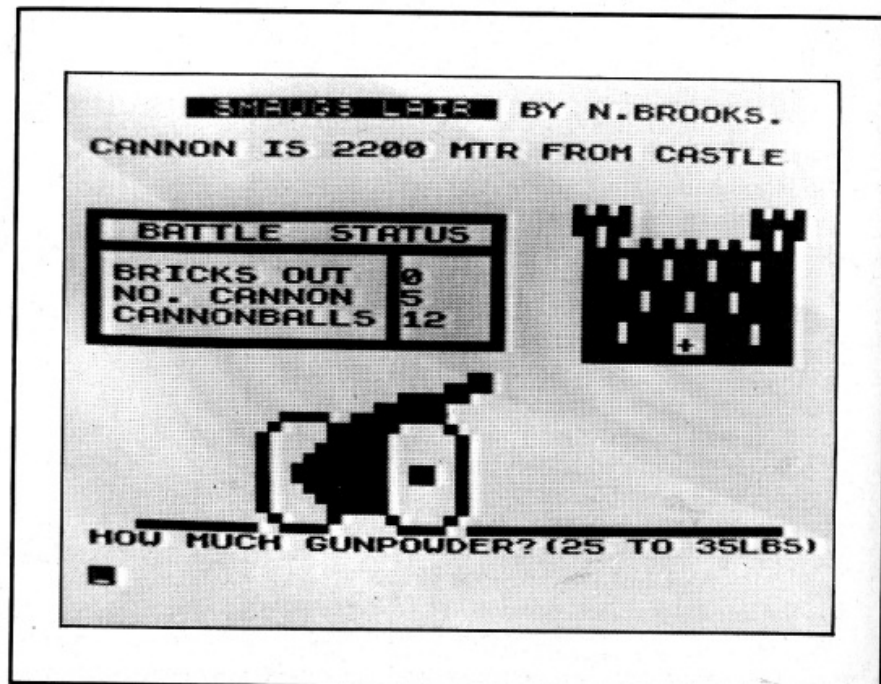

metres high) then the Y co-ordinate of the cannonball plot determines how many bricks are knocked out. (See program lines 1071 to 1079.) When in flight, the dragon may obscure the ball but it will always re-appear in the same position after the dragon has passed — unless, of course, it burns the cannonball to a cinder! You are finally asked if you wish to continue the game. Answering 'no' (N), puts you in retreat and the dragon wins.

At the end of the game (either with 6,000 bricks out of the castle or no cannon/cannonballs left) there is an appropriate 'picture show' to watch which I leave you to discover.

The odds slightly favour the Gunner Captain once an appreciation of charge and angle has been gained. Bear in mind that an angle of 45 degrees will send the ball the maximum distance for any

choice of charge (set at which, the castle is seldom damaged incidentally) and an angle of say 60 degrees will result in the same final range as that of 30 degrees, ie each 15 degrees either side of 45 degrees. However, the castle presents a smaller target when dropped on from above rather than hit broadside on, so for a more difficult game try always choosing angles over 45 degrees. I have yet to win doing this!

The more gunpowder you use, the faster the cannonball leaves the cannon and hence the further the cannonball will fly. Similarly, the angle of elevation affects the range. (I have used Newton's formulae for the motion of projectiles from my old 'A' level maths notes for this part of the program and have consulted books on cannons for details of range and charge to make the scientific aspects of the program as accurate as possible).

A graphical display of the cannon being adjusted to the angle chosen is shown next. (I make no apology for the slowness of this part of the program as I wanted to introduce the concept of 'angles' to my young family. Adding lines 2205 FAST and 2910 SLOW will alleviate any boredom.)

INTO BATTLE

The main action comes on the 'Battlefield' screen which follows on from the previous screen automatically. The cannon is displayed at the computer-selected distance from the castle and the cannonball is fired. Every fifth plot of the cannonball, the dragon flies from the castle. Unbeknown to the player, it has chosen at random whether to attack the cannon or the cannonball. If the dragon chooses the cannon there is a 50% chance of a hit. If the cannonball is selected, then the odds of a hit are only 20%.

VARIABLES ON A THEME

Listed here are the main variables used throughout the game:

| | |
|---------|--|
| BRIC | The number of bricks knocked out of the castle (6,000 bricks knocked out will win the game for you). |
| BALL | The number of cannonballs remaining (zero cannonballs left will result in you losing the game). |
| GUNS | The number of cannon you have remaining (zero cannon left will result in you losing the game). |
| ROUT | The 'I give up' code. |
| M | The distance between the cannon and the castle. |
| N | The random number used to generate the variable, M. |
| G | If G is equal to one, the dragon attacks the cannonball only. |
| X and Y | The co-ordinates of the cannonball. |
| A | The input for the angle of the cannon in radians. |
| B | The angle converted into radians. |
| U | The input for the amount (in lbs) of gunpowder used. |

Other variables are used but they only exist to aid the running of the program.

NAVAL MANOEUVRES

Can you stay afloat in this ZX81 version of the popular board game?

Written for the 16K ZX81, this version of 'Battleships' involves you taking on the computer in a naval conflict.

IN THE SWIM

As in the game we all know and love, the idea of the game is to sink your opponent's fleet before it manages to sink yours.

When you first run the program, the computer first provides you with a few brief instructions on how to play the

game. When you are sure you understand the workings of the game, the computer sets up its fleet on the right-hand playing area. Once this has been done, you position your own fleet.

You do this under instruction from the computer which invites you to give the co-ordinates of each ship in your fleet. You must position one battleship (represented by four squares), two cruisers (three squares), three destroyers (two squares) and four submarines (one square each). You position your fleet by first inputting the row co-ordinate on your 10 by

10 playing grid on the left-hand part of the screen.

You begin the game by having three shots at the computer's fleet. This is done in a similar manner to how you inputted your fleet, in that the computer asks you first for the row co-ordinate followed by the column co-ordinate. The computer will then have three shots at your fleet and so on. All shots and hits are shown clearly on the screen, and the winner is the one who destroys the other's fleet first. The player has the same chance of winning as the computer, so have fun!

HOUSE OF HORROR

It was a dark and stormy night (as Victorian writer, Edward Bulwer Lytton, used to say) when Chris Cox decided to write this program!

The plot of the game is that you have been transported to a deserted mansion, full of hidden treasure. All of the treasure was kindly left by the last owner of the house, but unfortunately he also left a number of his 'pets' to guard his fortune. And yes, you've guessed it, his 'pets' (in the shape of monsters!) are none too pleased by your intrusion. And if that wasn't

enough, you have to watch out for the roaming reaper who has a liking for people's heads — it's not too interested in the rest of your body though (need I say more!).

GO EXPLORING

Instructions appear throughout the program telling you in which direction you can go. You move around the randomly-generated selection of halls and stairways constantly exploring until you find the

Dare you enter the haunted house?

treasure, keys to open some of the doors and, of course, a grim selection of monsters.

The more coins you find, the less frequent large finds become; however, as you come across less coins, you'll find more keys and have more encounters which means you can explore more of the house.

The game ends when you have found over 2,500 coins, run out of strength warding off the monsters or you've had your head removed by the roaming reaper!

Happy hunting!

PROGRAM VARIABLES

- | | |
|---------|---|
| 5 | — Initialises the main variables used in the program. |
| 10 | — Finds the beginning of the display file. |
| 20 | — The starting position of your arrow character. |
| 210-230 | — The routine to find out if your arrow has hit anything. |
| 280 | — The routine to print on the screen how much you scored. |
| 710 | — Prints your points on the screen. |

A ZX81 version of the popular arcade game.

This is a game for the ZX81 with at least 3½K of RAM and has been written so that, apart from the enjoyment I hope you'll get from the game, you will also learn more about the capabilities of the computer.

The idea of the game is to drop your arrow, a 'V', into the mouth of a bottle. If you miss the mouth of the bottle or land in one of the other bottles, you score the amount of points indicated at the bottom of the bottle (printed in inverse print). You have ten attempts to score as many points as possible, and you lose one of your goes for each 'V' dropped. To drop a 'V', press any key apart from Break or Shift.

GOTTA LOTTA BOTTLE

When the program is RUN, the bottles appear and your '>' moves rapidly across the screen. Pressing a key will make your arrow fall from its path, hopefully into the mouth of a bottle. When your ten attempts have been exhausted, your score and the highest score so far will be displayed.

The program uses the memory mapped display of the ZX81 with at least 3½K. I have deliberately not included instructions in my program so that users with more than 1K but less than 16K can also enjoy the game.

I have used variables to represent areas of the program, for example:

70 GOSUB DRAWG

This line makes the program go

to the subroutine to print the bottles.
Here follows a brief explanation of some of the more important lines of the program.

If the user wishes to have a delay before the game starts, he or she should add the line:
7 PAUSE 4E4
Then, by pressing a key, the

game will start. When the program has been typed in, RUN 9000 will SAVE the program to tape and will then RUN the main program.

MATHS MAZE

A great game with an educational twist.

At the start of the game you must select a level of difficulty, from one to five, five being the hardest and almost impossible. The object of the game is to move around the maze, you being the inverse quotes, using the arrow keys, '5' to '8', until you find one of the signs: '+', '-', '*' or '/'. When you find one of these signs, you simply 'eat' it. The computer

will then clear the screen, and set you five questions, their hardness depending on the level of difficulty selected at the start of the game. After these five questions, you are given a 'percentage rating', depending on how many sums you answered correctly. After this, press any key and the faithful ZX81 will put you back in the maze to carry on the game.

ON LEAVE

You may leave the maze at any time, but obviously the idea is to get as many points as possible. You get one point for each correctly answered addition or subtraction question, and two points for each multiplication or divide question.

At the end of each game (when you have reached the exit) you are told your score and given three options: to play again at the same level, to stop, or to play again at a different level.

Your movement around the maze is quite fast for a BASIC program; this is due to the shortness of the loop (lines 100 to 300) and because the main work is done by subroutines.

Type in the program as published, then before RUNNING the game, type the following:

POKE 16510,0

PROGRAM DESCRIPTION

| | |
|-----------------|--|
| Lines 100-300 | Main routine. |
| Lines 1000-1080 | Print the maze. |
| Lines 3000-3060 | Sets the sums, deciding which sums. |
| Lines 3070-3168 | Set the addition sums. |
| Lines 3170-3269 | Set the subtraction sums. |
| Lines 3270-3369 | Set the multiplication sums. |
| Lines 3370-3800 | Set the division sums. |
| Lines 5000-5180 | End of game routine. |
| Lines 6500-6600 | Set the values for the sums. |
| Lines 6800-6840 | Clear the screen, leaving the top line. |
| Lines 8000-8500 | Variables routine. |
| Lines 8600-8900 | Introduction, also set level of difficulty. |
| Lines 9000-9020 | Load. The program will automatically run on subsequent loadings if the program is SAVED using GOTO 9000. |

QUESTION 5

| | |
|-----------|-------|
| 28+71=99 | WRONG |
| 63+98=161 | WRONG |
| 34+92=126 | RIGHT |
| 26+73=99 | RIGHT |
| 61+59=150 | RIGHT |

YOU GOT 3 RIGHT.
THAT IS 60 PERCENT.

PRESS "N/L" TO CONTINUE...

An example addition test.

NAUGHT BUT A GAME

The classic game of naughts and crosses for your ZX81.

This program has the ZX81 playing a pretty mean game of Naughts and Crosses against a willing opponent. The program requires about 7K of RAM to operate.

In this game you are the 'naughts' and the computer is the 'crosses'. The program is divided into several parts:

DRAWC — Draws the computer's piece.
DRAWP — Draws the player's piece.
WIN — Checks to see if someone has won or

COMP if it is a draw.
 — The computer's move.
PLAYER — The player's move.
CLEAR — Clears the player's prompts.
GRID — Prints the playing grid.

Each part of the program is called by the GOSUB command, for example GOSUB COMP is the subroutine for the computer's moves.

THREE IN A ROW

The following is a brief guide to

some of the more important lines in the program:

5005-5020 Find if one of the players has a row of three counters.
 5200 The player gets two points for each win.
 5320 The ZX81 gets five points for each win.
 6005-6008 Work out the average value of RND.
 8002 Ensure the print position is in the top left hand corner.
 8200-8210 Make sure that the scores do not run onto the board.

**** THE BOARD ****

PEEPER

Someone's watching you! A paranoid little program, this.

In this game for your 16KZX81, you are looking up at a four storey building. On each floor, there are five windows... and someone keeps looking out of them at you.

From your vantage point, you have a good view of the windows and whenever a face appears at one of the windows, you have the opportunity to fire a shot at it before it disappears.

GOING STARE CRAZY

A total of thirty heads could look at you, although the window they will choose will be random each time. When a face

appears at a window, you must position your character directly underneath using the '5' key to go left and the '8' key to go right. Then you can fire at the face; to fire a shot at a head on the first floor, press the '1' key, for a shot at the second floor press the '2' key, and so on.

Each time you hit a head, you score a total of 200 points. However, firing at higher level floors uses up more energy than firing at the lower floors; a first

floor shot will cost you 10 points, a second floor shot will count for 25 points, 50 points for a third floor shot and 100 points for a shot at a head on the fourth floor.

You start off the game with 1,000 points, but you'll soon find that a few missed shots at the fourth floor will quickly deplete your score. The game ends after 30 heads have appeared at the window or if you run out of points.

The game also includes a high score feature and instructions for the game's operation are included within the program.

FIVE CARD TRICK

You've got to hand it to us — another great game for the ZX81!

This program is a version of the card game, pontoon, for you to type in on your ZX81.

Including all the main features of pontoon, the program starts you off with £50 to gamble and the game will continue until you run out of cash.

TWISTING THE NIGHT AWAY

As in the card game you will be dealt a single card on which you must decide how much you would like to place a bet. Your second card will then be dealt to you. Should you be dealt two aces, the program automatically assumes the first ace is worth one and asks you whether you

would like the second ace to be worth one or 11.

With two cards in your hand, you must decide whether you want to 'stick' with your hand or 'twist'. If you 'stick', it means you are happy with your hand as it stands and do not require another card. Should you not have enough points in your hand, you can 'twist', which means you are dealt another card which will get you nearer the magic number of 21. Should your cards total more than 21, the computer will tell you that you have 'busted'.

Once you have stuck with your hand, the computer will work out its own hand and you will be told whether you have won or not. In the event of you and the computer both having hands which total the same, the computer will win — it's known in the 'trade' as 'banker's advantage'.

When you decide you have had enough of beating the computer at its own game, or you've been absolutely thrashed and you've lost all your money, you will be told your ranking as a pontoon player.

PROFIT PROPHET

The object of this program is to help a company or financial institution measure their profitability.

On RUNNING the program you will be greeted with a menu which will provide a route through to the particular ratio you require. Here follows a list of the facilities available with this program:

- a) Return on investment.
- b) Net profit percentage.
- c) Asset turnover.
- d) Gross profit percentage.

- e) Selling expenses/sales.
- f) Administration expenses/sales.
- g) Establishment expenses/sales.
- h) Financial expenses/sales.
- i) Sales and distribution expenses/sales.
- j) Research and development expenses/sales.
- k) Fixed asset turnover.
- l) Current asset turnover.
- m) Working capital turnover.
- n) Debtor's turnover.
- o) Rate of stock turnover.
- p) Current asset ratio.
- q) Acid test.

A serious program to help you get to grips with your business.

- r) Average period of credit given.
- s) Average period of credit received.
- t) Earnings per share.
- u) P.E. ratio.
- v) Dividend per share.
- w) Dividend yield.
- x) Dividend cover.
- y) Capital employed.

As you can see from the long list of options, the program certainly tries to fill in the gaps of your business knowledge.

In fact, the author has added a number of program notes which will be revealed should you choose certain options. These are not part of the operation of the program but illustrate certain patterns which developed over a period of trading months so were added for the author's convenience. Should these not apply to you they could be left out or have new comments substituted.

STOCK CONTROL

Keep efficient control of your stock with this splendid program.

where each file contains stock of a certain kind. For example, one file could deal with food stock, another with sundries, and a further file could deal with stock for the office. In this way, it would be possible to have as many stock items as you wish on file. A further program could then be written, by the more enthusiastic of you, to index the files and what they contain.

As a last note, the product reference code should be unique to each item and should not be a sub-code of another item. For example, if you enter a code, food, and there already exists a code of this name, the computer will return the first found. However, the entry of the new items routine will tell you if a code already exists, so this should not cause any problem.

SPECTRUM CONVERSION

The program is fairly straightforward and the listing self explanatory, and can be converted to run on the ZX Spectrum with minimal alterations.

First, alter the number in line 100 to 50 for the 16K Spectrum and 250 for the 48K Spectrum. Then, delete all the lines with FAST or SLOW in them. Finally, you may wish to change all the upper case messages to lower case, but this is not absolutely necessary.

This program for the 16K ZX81 allows the handling of stock control files.

Each file set up with deal with up to 100 stock items and will tell you which items require reordering. The program itself is menu driven and offers nine main options: you may enter or delete stock; enter the amount re-ordered; delete files or enter new items; save the file; or print

out a list of all stock items and suppliers via the printer.

The subroutine for each option appears starting at line number 1000 multiplied by the option number. These are called in line 390 by GOTO 1000 * I, where I is the option chosen.

The option to save a file under a file name allows the facility to run several files,

AIR RAID

Run for cover — and have a smashing time.

In this program, Stephen has taken trouble to incorporate moving graphics, simple rules and an emphasis on strategy rather than relying on Lady Luck.

The rules of the game are quite simple. You begin the game with 30 bombs for your skycraft and you can release a bomb by pressing the 'O' key. Your aim is to hit all the enemy ships and planes you can within the restriction of how many bombs you have. If a ship reaches the landing stage before you can destroy it you will lose one of your valuable bombs, and you are further restricted by only being able to fire one bomb at a time (if there is a bomb still on-screen, you will not be allowed to fire another).

the sea harbour — you travel across the screen from right to left, and when you disappear on the left-hand side you miraculously appear on the right-hand side again. The white speck in the centre of your skycraft indicates that you have a bomb on the board.

Ships will appear on the left-hand side of the screen and slowly move toward the landing stage. As you move across the screen in your skycraft, you must decide when to release your bomb in order to destroy the ship. If you manage to score a direct hit on the ship, you will be rewarded with the ship being swallowed up by the mysterious deep. However, if you miss the ship, the bomb will explode

tactic you could employ is the 'shot in the dark' option in which you release a bomb before a ship has yet come onto the screen. But remember, you have only 30 bombs, so it's best to make them count.

When you have used up your 30 bombs, the display will scroll upwards so that the 'sea' ends up at the top of the screen. The score you have achieved during the game is then displayed, followed by the top highest scores of the day. The sea will then begin rolling again and the ZX81 will wait for you to press 'O' signifying that you would like another game.

To help you decipher the program listing, perhaps the

PLAIN SAILING

When you first RUN the program, the Score Advance Table will appear on the screen. From this you will be able to see that ships are more valuable (in terms of how many points are scored) to destroy than planes. The aircraft are not easy to hit — but there is no penalty for allowing a plane to escape your fire.

After pressing the 'S' key, the score table is erased and you should get your finger over the 'O' key — this is the only control key used in the game. Your ammunition will appear as a series of 'grated railings' at the top of the screen. The sea will appear at the bottom of the screen with a landing stage in the bottom right-hand corner. You are positioned in a skycraft, sited just below your ammunition dump at the top of the screen.

Your skycraft slowly 'circles'

harmlessly in the sea and the ship will dock at the landing stage, its troops will disembark unopposed and steal one of your bombs.

Periodically, an enemy plane will fly across the screen from left to right, moving twice as quickly as their naval colleagues. They are not trying to reach the landing stage, their object is to get between you and the ships, thus blocking your bomb. There will only ever be one ship or one plane visible on the screen at any time, but a plane and a ship may be seen together.

A SHOT IN THE DARK

One of the problems you will encounter is judging when to release your bombs so that they will destroy the ships. One

following would be useful. The ships and aircraft are held in string arrays, A\$, B\$ and C\$. Cruisers, represented by A\$, are generated as follows:

A\$(1) — "Space, Graphic 8, Graphic 4, Space"
A\$(2) — "Space, Graphic 8, Graphic 5, Space"
A\$(3) — "Graphic R, Inverse

Space, Inverse Space, Graphic E"

B\$ is used to represent the aircraft and is comprised of the following:

B\$ — "Graphic 7, Graphic 7, Graphic 6, Graphic E"

Battleships are held in C\$ and are made up as below:

C\$(1) — "2 Spaces, Graphic 3,

Graphic 5, 2 Spaces"

C\$(2) — "2 Spaces, Graphic 8,
Graphic 5, 2 Spaces"

C\$(3) — "Graphic Y, Graphic
6, Graphic Q, Graphic W,
Graphic 6, Graphic T"

C\$(4) — "Space, Graphic R, 2
Inverse Spaces, Graphic E,
Space"

The ammunition dump is
generated in line 134 and
comprises 30 Graphic Qs. The
string array, D\$, is your skycraft
and is shown in line 135 as an
Inverse Dot and a Space. Line
150 is made up of 31 Graphic
As and one Inverse Space.

E\$ and F\$ are alternating
Graphic As and Graphic Ds
ending in an Inverse Space.
Note that E\$ and F\$ run in
antiphase and alternate in
subroutines in lines 7000 and
7020 to make the wave-like

motion of the sea.

Lines 200-270 represent the
'core' of the program. The rest
of the listing comprises a
number of routines which are
called from time to time from
the main program. Try working
out what does what.

Here is a list of variables
used in the program to help you
work out how the program
works.

Array V(6)— The six best
scores.

Array V(3)— Whether or not a
plane or ship is
visible.

SC— Player's score.

F— Flag controlling
whether or not a
bomb is loaded
aboard your aircraft.

YU— Position of waves

on the sea.

PO— Position of last
ammunition in the
dump.

AMM— The number of
bombs left (plus
one).

X— The horizontal
position of the
skycraft.

Y— The horizontal
line of the falling
bomb.

AS— The controlling
variable for what will
appear on the screen
next.

L— Control variable
in loops.

N— Control variable
in loops.

SB— Individual score
awarded for hitting a
ship or plane.

AMMO: 29

CODING GRAPHICS

Increase your character size with this great utility.

The purpose of the program is to enable screen displays of large characters or user-defined graphics to be created quickly and easily by calling the character or graphic from a library of symbols stored in an array. On program termination, the screen display is saved in high memory, and is then available for inclusion in a new program.

The program is entertaining to use, and some interesting effects can be achieved by mixing both normal and inverse characters on the screen. The symbol library can hold 54 characters, each designed on a three by five matrix, and as an aid, I enclose a list showing the numeric data required to create 54 possible characters. The program may be used with an incomplete library, any new characters being added as and when required, with the option to re-define any previously created character.

HOW THE PROGRAM WORKS

Lines 20 to 240 are concerned with creating a graphic character, and storing the associated data in an array. The array subscript C is calculated by the subroutine at line 640, after which a check is made at line 100 to see if the character has already been defined. When character definition is completed press Newline to enter the PLOT routine, which works as follows.

Lines 260 and 270 set the initial printing position for the first character to be plotted. Line 290 requests a character, the subroutine at line 640 converting C\$ onto the appropriate location C in the array. The individual bytes

stored in this string location are then POKed into the first 15 locations of the line 1 REM statement. This operation is carried out by lines 330 to 390.

Line 410 copies the screen display to above RAMtop. Line 420 puts the chosen character at the initial print position. Lines 430 to 470 scan the keyboard for an input, with any X-Y moves incrementing or decrementing the values held in

addresses 16542 and 16544.

Line 500 copies the screen display back from above RAMtop, a jump then being made to the 420 where the chosen character is re-printed. Line 470 permits an escape from this loop, enabling the chosen character to be incorporated into the screen display when line 410 is next executed.

When character plotting is completed, pressing Newline

enters the invert routine, executed by line 560. Line 570 stores the screen display above RAMtop. The final option is to finish the program by typing Y, or Newline to re-enter the plotting routine.

CREATING THE PROGRAM

Reserve some memory for the machine code routines by typing the following direct commands:

```
POKE 16388,0
POKE 16389,125
NEW
```

This sets RAMtop to 32000. Type in the Hex loader program figure 1, ensuring that line 1 contains at least 109 characters. Enter the Hex code as shown in the left-hand column of figure 2, terminating each line of code with Newline. If a mistake is made in typing, pressing Newline will select 'edit' mode indicated by an inverse 'E' being displayed. Now type the correct code and continue, or re-edit as required. Terminate data entry by typing ZZ. Delete all lines except line 1, then press Clear.

As a direct command, type DIM A\$(54,5,3) to create an array of 54 characters. Note that this direct command avoids the use of a line number in the program, and so careless use of GOTO cannot accidentally re-DIMension the array and destroy previously entered data. RUN will also destroy data, and so the program should always be restarted using GOTO 1. Add the BASIC lines such that the program is now as shown in figure 3. Type GOTO 1 and use figure 4 to create the characters

required, entering a number followed by Newline for each of the 15 entries per character. The character is built up and displayed as each entry is made. When data entry is completed, opt out of this routine by pressing Newline. Step through the options by successful presses of Newline, typing 'Y' in response to 'EXIT PROGRAM?'. To save the program on tape, start the cassette recording, then type GOTO 620.

USING THE PROGRAM

Ensure the RAMtop is set to 32000. The program will start automatically when loaded, but if a re-start is required type GOTO 1. In response to 'CREATE WHICH CHARACTER?' press Newline. The next reply will produce the chosen character in the lower left-hand corner of the screen. Steer the character into place and fix using the keys as prompted.

The next character selected will be initially superimposed on the previous one, and may be manipulated as before. You can opt out of this routine by pressing Newline. For inverse graphics press 'Y' in response to the prompt. A 'Y' response to the next prompt will terminate the program. A screen dump Fig. 5, shows typical characters. The display has now been saved in high memory. To call this display into a new program press New, then enter the BASIC shown in Fig. 6. Run this program, and when the report code 0/60 appears, each program line may be deleted. The graphics may now be displayed, either by a direct command PRINT Z\$ or as a

program line, eg 10 PRINT Z\$ followed by GOTO 10.

A LOAD OF CODE

The machine code routines have starting addresses as follows:

```
16529 C.UP
16541 PRINT
16591 C.DN
16604 INVRT
```

The routines C.UP and C.DN use the LDIR instruction to block-move 727 bytes of code from the address of the display file to address 32000 and *vice versa*. The Print routine works as follows. The B and A registers hold the X and Y printing offsets with respect to screen 0,0. Steps 19 and 20 increment the display file address by an amount equal to the value in register B. Steps 25 and 26 then increment the display file address by an amount equal to 33 times the value in register A.

Having established the printing position, steps 31 to 34 print the first three bytes of the enlarged character. Steps 35 to 37 then increment the display file address by 30 point to the corresponding printing position on the next line, and the next three bytes are then printed here. This process is repeated five times to print the complete character, at which time the C register, previously loaded with five at step 27, has been incremented to zero and a return to BASIC is made.

The INVRT routine finds each printing character in the display file, adds 128 to the current value, then overwrites, the old value.

SPIRALLING INTO GRAPHICS

The author has developed a fascinating spirograph program which even allows 'impossible' patterns to be generated.

Spirograph patterns are formed by both the interior and exterior epicycloid curves.

There are two basic equations for these curves:

INTERIOR EPICYCLOID:

$$X = (A-B) \cos I + H \cos$$

$$((A-B) I/B)$$

$$Y = (A-B) \sin I - H \sin ((A-B)$$

$$I/B)$$

EXTERIOR EPICYCLOID:

$$X = (A+B) \cos I - H \cos$$

$$((A+B) I/B)$$

$$Y = (A+B) \sin I - H \sin$$

$$((A+B) I/B)$$

where A is the radius of the large circle (circle A), B is the radius of the small circle (circle B) and H is a point on the circumference of the small circle.

THE EPICYCLOID

This is the curve traced out by the point H on the circumference of the small circle, which rolls on the inside or outside of the large circle. As with the commercial toy, 'Spirograph', the point H can be moved from the circumference to any point along the radius to the centre, where it will just draw a circle.

When the point H is nearer the circumference of the small

circle, the patterns tend to be geometric in shape. When point H is moved nearer to the centre of circle B, the curve tends to be more floral, or organic in shape. The general program for the interior epicycloid is:

```

1 INPUT A
2 INPUT B
3 INPUT H
10 FOR I = 0 TO 2 *PI STEP
PI/10
20 LET X=(A-B)*COS I+H
*cos ((A-B)* I/B)
30 LET Y=(A-B)*SIN I-H*SIN
((A-B)*I/B)
40 PLOT 30 + X, 22 + Y
50 NEXT I

```

Some samples of the sort of patterns that can be generated.

DRAWING PATTERNS

The basic shapes of the hexagon, pentagon, square, triangle and ellipse can easily be entered into this program. Anything higher than a hexagon tends to become indistinct. To draw other patterns, the value for I has to be changed. It varies, on the ZX81, from two to 26 times PI.

There are a few ways of increasing the variety of patterns, but with low resolution graphics, the number is restricted. The three best ways of increasing the variety of patterns is:

1 'Moving to the centre', that is, moving the point H from the circumference of circle B to near its centre. Try this, with A set equal to 20 and B to 10.

3 FOR H=2 TO 10 Step 4 60
NEXT H

2 'Moving to the side', that is, rotation of the pattern, which can be done by moving an angle, which must be added to the general program. Try it, with A equal 20, B equal 10, H equal to 8, and with the I loop FOR 10 to 2 *PI STEP PI/10. You'll need to add the following:

```

4 FOR J=0 TO 3*PI/2
20 LET X=(A-B)*COS
I+H*cos((A-B)*I/B+J)
30 LET Y=(A-B)*SIN
I+H*sin((A-B)*I/B+J)
60 NEXT J

```

3 'Moving to the centre and the

side', that is, movement of point H and rotation. The program is as in two, with the addition of:

```
3 LET H=0
6 LET H=H + 2
```

There is also the 'extended internal pattern' which is achieved by adding the following to the general program:

```
3 LET F=10
8 FOR H=2 TO 8 STEP 2
9 LET F=F40 PLOT F + X,
22 + Y
60 NEXT H
```

RATIOS

Although the low resolution graphics tend to be limiting, the computer offers experimentation in other directions, which are not available on a real Spirograph. Besides the obvious one of a greater variety of ratios, there is the possibility of putting the smaller number in first, and the bigger number in

second, as though the larger circle is rolling inside the smaller one.

The following ratios will fit easily into the general program:

```
A 4 5 6 7 8 9
B 13 13 13 13 13 13
H 10 10 10 10 10 10
```

And for these use FOR I=0 TO 26*PI

```
A 4 7 8
B 9 9 9
C 8 8 8
```

For these use FOR I=0 TO 18*PI

```
A 4 6 8
B 11 11 11
H 9 9 9
```

And for these we suggest FOR I=0 TO 22*PI

Some of these have an almost mandala-like quality.

The following can be used in the exterior equations:

```
A 4 5 6
B 7 7 7
H 6 6 6
```

And use FOR I=0 TO 14*PI

```
A 4 5
B 9 9
H 6 7
```

FOR I=0 TO 18*PI

EXPERIMENTS

Another direction for experimentation is based on the moving point H, program one. Put the H loop into the I loop. This will draw the points of H first (FOR H=0 TO 6).

And finally, a way of showing the smaller circle moving inside the larger circle, by using the rotation program, is as follows. Put the J loop inside the I loop. This will draw just six circles. Use FOR I=0 TO 2*PI STEP PI/10 and FOR J=0 TO 2*PI STEP PI/10.

SPECTRUM

These super value for money cassettes are only available via MAIL ORDER, from ORWIN SOFTWARE

ZX-81

FOR 16K SPECTRUM (will also run on 48K Spectrum)

CASSETTE A
GHOST GOBLER
Eat the ghosts before the ghosts eat you. Eat a star and you can chase the ghosts for a while.

Ten programs for £6

TANK BATTLE For 2 players simultaneously or play against the computer. Each player has 2 rotate controls and move and fire controls. The tanks fire steerable missiles.
PHOEBUS A puzzle.
BLACKSPOT Gobble the stars and avoid running into black spots created by crossing your own path.
CUBE Manipulate a cube any size from 2x2x2 to 7x7x7.
MINEMINE Collect the crowns while avoiding the mines and the electrified fence.
plus an extra...
GRAPHIC DEMO Did you know your Spectrum could do all this?

ALIENKILL Control lasers, rockets and a force field to stop the aliens from landing.
MOUSETRAP Trap the mouse in the corner but not anywhere else.
REVERSI A game of skill with simple rules but sophisticated tactics. Play against the computer.
LASER DEFENCE Control the laser sight to shoot down the alien ships. Machine code sound routines.

EDUCATIONAL COMPENDIUM FOR 16K/48K SPECTRUM £6

All these programs on one cassette.

These programs were developed for use in a Junior School and have been in regular use there for some time. Older people also find them interesting and fun.

TORTOISE GRAPHICS: an educational graphics language.

16K version commands include: forward, left and right through a specified angle, wipe, pen up and down, paper and ink colour, macro, edit.

48K version has extra commands including: backward, quit, cancel, printer and tape commands, auto, home, variables, loops.

TORTAIL & TORTMAZE: 16K games using the forward, left and right commands. These are good for learning a feeling for distances and angles and are fun to play.
REVEAL: an addictive 16K word game. A piece of writing has had its letters rubbed out and you have to find out what they are. You buy letters or try to predict them. Included are 20 textfiles to be solved and a textmaker which will let you input your own text and store it on tape for someone else to solve.
EQUATION INVADERS: a 16K game to make simple equations more interesting.

CENTIPOID PLUS THREE for 48K SPECTRUM. £6

CENTIPOID (machine code).
Centipoid is a full-featured arcade game with mushrooms, spiders, webs, scorpions, goblins, indestructible dead segments of centipoids that drop down on you, and, of course, the centipoids themselves.

You can choose your own control keys. It is playable from the keyboard or using any joystick interface which, like AGF Interface II, makes the joystick behave like keys on the keyboard.

Plus these games in Basic for the 48K Spectrum on the same cassette.

3D TIC TAC TOE
A 3D game of skill played against the computer.

CASSETTE 1: eleven programs including 7 in machine code: React, Invaders, Phantom Aliens, Maze of Death, Planet Lander, Bouncing Letters, Bug Spat, I Ching, Coldebreak, Robots, Basic Hangman.

for 1K ZX-81

"... worth every penny."

£3.80

Sinclair User, April '84

ZX SCRAMBLE with 3 stages. (machine code) Bomb and shoot your way through the fortified caves.

PLANETOID (machine code) Rotate, move, fire and hyper space controls. Wide range of choice of speed and difficulty.

SPACE RESCUE (machine code) (previously available from Mindseye)

BLITZ (machine code)

7 of the 8 games are in machine code, because this is much faster than Basic. (Some of these games were previously available from J. Steadman).

CASSETTE 2: ten games in Basic: Reversi, Awari, Laser Bases, Wordmaster, Rectangles, Crash, Roulette, Pontoon, Penny Shoot, Gun Command.

for 16K ZX-81

£5

for 16K ZX-81

CASSETTE 4 8 games for 16K ZX-81 £6

GUNFIGHT (machine code)

INVADERS (machine code)

GALAXY INVADERS (machine code)

Fleets of swooping and diving alien craft to fight off.

SNAKEBITE (machine code)

Eat the snake before it eats you. Variable speed (very fast at top speed).

LIFE (machine code)

A ZX-81 version of the well known game.

3D TIC-TAC-TOE (Basic)

Played on a 4x4x4 board, this is a game for the brain. It is very hard to beat the computer at it.

7 of the 8 games are in machine code, because this is much faster than Basic.

(Some of these games were previously available from J. Steadman).

CASSETTE 5 8 games for 16K ZX-81 £6

BYTE-MAN (machine code)

(previously available from Mindseye)

BREAKOUT (machine code)

PLANETOID (machine code)

Rotate, move, fire and hyper space controls. Wide range of choice of speed and difficulty.

DODGEMS (machine code)

Dodge the computer's car while eating the dots.

DRAUGHTS (machine code)

Three skill levels.

MERCHANT (Basic)

Make your fortune on trading voyages in the Mediterranean and beyond.

7 of the 8 games are in machine code because it is much faster than Basic.

CASSETTE 3: eight programs including 1 in machine code: Starship Trojan, Star Trek, Princess of Kraal, Battle, Cube, Kalabasz, Secret Messages, Martian Cricket.

for 16K ZX-81

£5

for 16K ZX-81

"... well thought-out and the graphics are good for a ZX81... provides value for money."

Sinclair User, April '84

"quantity as well as quality"

Sinclair User, Oct '82

"If each game was on a separate tape and selling for £5 each I would still recommend them"

ZX Computer, Oct Nov '82

"Easy to operate, graphically impressive and good value for money."

The Times, 11th Dec '82

"Definitely good value for money at £6"

A smooth clear display and a relatively fast response from the keys. Graphics are as good as you will ever get on the 81."

What Micro? Nov '83

"New polish on old favourites."

the quality of the software and the smooth action displays created on the screen make the programs worthwhile for anyone who has a ZX-81 and plays games using it.

It is pleasant to see that Orwin's kind of quality is available again."

Sinclair User, Sept '83

"Among the best reviewed was Cassette 5 from Orwin Software."

For a mere £6, you get eight top quality games.

All the games are of very high quality and would cost £4 or £5 if sold separately.

Many of the other software houses could learn a lesson from these."

What Micro? Games supplement, Nov '83

Please make your cheques payable to ORWIN SOFTWARE and send order to ORWIN SOFTWARE, Dept (PER), 25 Brownlow Road, London NW10 9QL.

Prices shown include P&P in UK & Eire.

Send SAE for detailed catalogue (state which computer).

5054362

For orders placed at the Post Office

SHOOTER

Simple but fun, that's how we view this game.

Here is a program for the 16K ZX81 which combines machine code with BASIC to form a simple, but fun to play, game.

In this listing you will first need to enter the machine code using a machine code loader program such as the one

included in this article. You will need 16K of memory because the machine code looks for 118, the Newline code, which means that unless RAMtop is more than 3.5K the machine code will not allow you to fire at the target.

To enter the machine code,

first enter the following program:

```
1 REM .....
2 POKE 16510,0
3 FOR N=0 to 11
4 INPUT I
5 POKE (16514+N),I
6 NEXT I
```

Now, RUN the program and input the following machine code (the commas separating the numbers represent you pressing Newline):

42,14,64,126,254,118,200,
54,22,35,24,247,

Now, remove all the lines except line 0, and type in the main body of the program shown below.

ON TARGET

Once you have typed in the whole program, type RUN and you are ready to start the game. On the right of the screen, the target will appear and on the left a column of arrows will be seen. When the arrow is in line with the target, press the 'F' key to fire.

You get ten goes to hit the target, after which you will be given your score.

```
0 REM E:RND7/ RUN
4 LET S=0
5 FOR G=1 TO 10
6 LET L=0
7 CLS
8 LET A=INT (RND*15+5)
10 PRINT AT A,31;"■"
11 FOR N=0 TO 25
12 NEXT N
20 FOR N=1 TO 21
30 PRINT AT N,0;">";
40 IF INKEY$("<") THEN LET L=US
R 16514
50 IF L<>0 THEN GOTO 65
60 NEXT N
65 IF N=A THEN LET S=S+1
70 NEXT G
75 CLS
80 PRINT "SCORE=";S;" OUT OF 10 SCORE=3 OUT OF 10
0"
90 PRINT AT 10,0;"PLAY AGAIN
```

```
(Y/N)?"
100 IF INKEY$="Y" THEN GOTO 4
110 IF INKEY$="" THEN GOTO 100
```

A screen illustration from the program, Shooter.

Little Brothers should be seen but not heard.

REGULAR, CONDENSED, OR EXTENDED FACES.

CUT SHEET A4 OR ROLLER PAPER.

BATTERY OR MAINS OPERATED.

A maxim which eloquently describes the Brother HR-5.

Less than a foot across, it's nonetheless loaded with features.

But there's one thing the HR-5 won't give you. Earache.

For the annoying 'clickety clack' many printers produce is mercifully absent from the HR-5.

Quietly efficient, it delivers high definition dot matrix text over 80 columns at 30 c.p.s.

The HR-5 also has something of an artistic bent.

Being capable of producing uni-directional graph and chart images together with bi-directional text.

It will also hone down characters into a condensed face, or extend them for added emphasis.

Incorporating either a Centronics parallel or RS-232C interface, the HR-5 is compatible with

most home computers and popular software.

Perfectly portable, the battery or mains operated HR-5 weighs less than 4lbs, and has a starting price of only £179.95 (inc.VAT).

Which is really something to shout about.

PLEASE SEND ME MORE DETAILS OF THE REMARKABLE BROTHER HR-5 PRINTER.
