Acorn to launch Electron in March

ACORN Computers is to launch its long-awaited Electron micro in March "for sure", according to managing director Chris Curry.

It will be priced at £150, pitching it very close to the Sinclair Spectrum and Oric 1, with which it is intended to compete.

The Electron will offer, essentially, BBC computing at a rock-bottom price. It has the

same basic keyboard, although with slightly fewer keys, and the same screen display, though without the highest resolution graphics option. All the keys will be user-definable for maximum flexibility: "That means you can redefine the whole keyboard if you want to make a special version of the machine to do a specific job" says Curry.

Continued on page 5

Chris Curry, Acorn's Managing Director.

Software series for 64

COMMODORE has announced details of its initial software plans for the new Commodore 64 micro-computer.

Gortek and the Micro Chips is the first offering — a guide to simple Basic programming presented in the form of a space adventure game. *Gortek* is available now, price £12.95, in two cassettes containing 12 chapters of the 'space' lessons and a 44-page Basic teaching book.

Also available is the *Simon's Basic* extended Basic and graphics cartridge giving 114 extra commands. The structured Basic gives *Proc*, *If-Then-Else* and tool-kit type commands. The additional graphics commands include *Circle*, *Paint*, *Draw*, *Trace* and *Arc*.

February should see a range of business and utility programs — *Easy Script* word processing, *Easy Calc* financial planning, *Easy Stock* stock control and *Easy Spell*.

The first games material will follow in March.

A three-dimensional game of noughts and crosses for one or two players. Also includes a zero player option where the machine plays itself. Can you out-think your Dragon? Dragon Data Approved

THE EDG GRAPHICS PACKAGE £24.95

FOR THE BBC MODEL 'B' microcomputer

An advanced picture drawing system developed by a firm of consulting engineers to the oil and utility industries world-wide. Uses cassette tapes for software and picture storage and is controlled entirely by normal keyboard input — no extra hardware required. The main system features are:

- * Picture drawing in model 0, 1 or 2
 - * Actual and Logical colour changes at any time
 - * Drawing functions:
Lines, boxes, circles, arcs, text, shape repetition
 - * Drawing aids: Grid, elastic band, save and home cursor (5 positions)
 - * Colour fill
 - * Text window showing x,y cursor position, length, angle, colour menu and current colour
 - * Saving and Loading of picture using cassette tapes
 - * Multi-file pictures facilitating very complex drawings
 - * Flashing cross-hairs cursor
 - * User instructions/prompts
- This package comes complete with a spiral bound manual.

Send SAE for catalogue of our full range of Dragon and BBC model B software.
Cheques or postal orders payable to Salamander Software,
27 Ditchling Rise, Brighton, East Sussex BN1 4QL. Tel: 0273 771942.

Please add 50 pence P & P to all orders.
Dealer enquiries welcome. Programmers wanted: Good royalties paid.

How to submit articles

Articles which are submitted for publication
should not be more than 3,000 words long. The
articles, and any accompanying programs,
should be original. It is breaking the law of
copyright to copy programs out of other maga-
zines and submit them here — so please do not
be tempted.

All submissions should be typed and a double
space should be left between each line. Please
leave wide margins.

Programs should, whenever possible, be
computer printed.

We cannot guarantee to return every submit-
ted article or program, so please keep a copy. If
you want to have your program returned you
must include a stamped, addressed envelope.

Accuracy

Popular Computing Weekly cannot accept any
responsibility for any errors in programs we
publish, although we will always try our best to
make sure programs work.

Editorial

Ham, the first chimpanzee in space,
died in an American zoo last week.
Twenty-six-year-old Ham established
himself in the record books in 1961,
when he was launched into space as a
prelude to America's manned space
program.

The death of a chimpanzee, even
one as notable as Ham, might not
seem to be a particularly memorable
occasion. But, it is an indication of the
passage of time.

The last 20 years have been
marked by some of the greatest
achievements in man's history. We
have put men on the moon, created
babies in test-tubes and transplanted
hearts. We have also run faster, built
higher and travelled further than ever
before.

But, the advent of cheap, easily
available, micros may yet have the
most impact on our lives. The micro
revolution that is taking place almost
unnoticed is going to change the way
in which we live, work and even the
way in which we think. This is the age
of the micro, if not the train.

Ham was a pioneer of the space
age, just as the ZX81 is a pioneer of
the micro age. Twenty years from now
people may well remember the ZX81,
I doubt if they will remember Ham.

ROMIK SOFTWARE

24 Church Street, Slough SL1 1PT. Telephone: Slough (STD 0753) 71535

SHARK ATTACK For unexpanded Vic20

You are in shark-infested waters after being thrown overboard from a pirate ship. Your only protection being an atomic net which you trail behind you, trying to cover all the visible ocean and ensnare the sharks at the same time. Beware of stopping or covering your tracks for too long, if you do, then the sharks will escape and come after you. Watch out for the ever increasing deadly octopuses (sometimes the sharks will eat part or all of one!)

MOONS OF JUPITER

For expanded Vic20, 3K, 8K or 16K

You are the Commander of a fleet of destroyers looking on from the safety of a mother ship, you send in one destroyer at a time to blast a passage through the MOONS OF JUPITER. Your destroyers have to dodge, and blast the UFOs... Watch out for the Gologs they can smash your destroyers, but you cannot harm them.

A Machine Code Arcade Quality Game SEA INVASION Unexpanded Vic20

Fight off the attacking sea creatures for as long as you can. Shoot the whale for a surprise score, watch out for the crabs, starfish and octopuses.

MARTIAN RAIDER For unexpanded Vic20

Skim as close as you dare to the surface of the planet, devastating the Martian cities, destroying ammunition dumps (gaining more time), shooting down the ground-to-air missiles.

SPECIAL OFFER... C4 COMPUTER CASSETTES £2.50 for 10; £20 for 100

Available post free from the above address only

ROMIK PROMISE A MINIMUM OF ONE NEW GAME EVERY MONTH

MULTISOUND SYNTHESIZER For the unexpanded Vic20

The Vic Multisound Synthesizer is very flexible and can be played in more ways than can ever be explained here, to create music and special effects. For example, create any tune, up to 255 notes (after following appropriate instructions), then press "F1" or "F3", then key "9" and enjoy the added effect. Now hit "+", listen to the difference. For a surprise — hit "—". Now add a melody over the top — hit key "8" then "7" — now play a melody, or experiment. Have fun!

MIND TWISTERS

For unexpanded Vic20

Four games to stretch your brain
Blackjack, Decipher, Four Thought and Teaser are our computerised versions of very popular home games and will test your mental agility and skill for many a long hour.

SPACE ATTACK

For the unexpanded Vic20

Space Attack is a game of skill. You as the pilot of an intergalactic battleship have to fight your way through wave after wave of various alien spaceships.

Electron plans

Continued from page 1

The Electron will use BBC Basic, and Acorn's intention is to make most of the Acornsoft software for the BBC machine available for the new machine at the time of its launch. The operating system is only marginally different but, according to Curry, where a program requires modification there will be a special Electron version.

Savings have been made by tearing away all the interfaces which make the BBC micro such a flexible machine. The Electron will be offered with only a tape interface and VDU output. Eventually, a set of modular interfaces which plug into the back will be offered. Using these will upgrade the machine to BBC Model A standard, but the combined price of Electron plus add-ons will be as high as that of the Model A.

Chris Curry believes that the market into which Acorn will be selling the Electron likes add-on modules: "We are only producing these modules in order to compete with the market leader, which is undoubtedly the Spectrum" he said. Joysticks and games paddles will be relatively cheap add-ons — Econet networking and disc systems will cost rather more.

Together with a range of fast games software, Acorn's change of direction is indicated by its move into the high street. The Electron micro-computer is to be sold through the retail chain stores, though Curry has yet to finalise the details. At the same time — like the company's other computers — Acorn will sell the Electron by mail-order.

TI aims product at Sinclair computers

TEXAS Instruments has announced details of a new low-cost microcomputer and high-speed 'microdrive' data storage unit.

The new 16-bit micro, the TI 99/2 will go on sale in the UK in July. "It has 4K user Ram and will sell for well under £100 — nearer £70 than £80" according to TI's product marketing engineer, Robin Frowd.

The machine is without colour and sound but is expandable in 16K units to 36K. Based on the TMS 9995 16-bit processor it is heralded as being considerably faster than the TI 99/4A machine which uses the TMS 9900 chip.

The new machine has a Rom cartridge slot and is fitted with an RS232 interface.

Most software in Basic for the 99/4A will run on the 99/2, but without sound and colour routines. Unlike the earlier

machine, the 99/2 also has a full assembly-language programming capacity.

At the time of launch the new computer will have about 20 programs available for it on cassette. Two Rom cartridges will also be available — *Learn to Program*, for languages such as Forth, and *Learn to Program in Basic*.

Two new peripherals have also been announced to accompany the new computer.

A super high-speed 'wafer-tape' drive has been announced. This unit has a capacity of 50K with a data transfer rate of 8,000 baud, and connects to the computer via the RS232 interface. It is expected to cost £150.

A four-colour printer/plotter will also be released. Although the TI 99/2 is a monochrome machine, the colours of the printer can be addressed from the computer.

New Apple micro as IBM gets UK debut

APPLE Computers has publicly shown its new Lisa micro for the first time in the same week that IBM has announced the long-awaited UK launch of its Personal Computer.

Lisa — a mnemonic for Local Integrated Software Architecture — "represents a new concept in micro-computing" according to Apple sales chief Keith Hall.

The Lisa unit offers a package of integrated hardware and software allowing more

than one software package to run at the same time. It is operated by an exciting new device — the 'mouse'. This small desk-top peripheral, used to direct a sophisticated cursor-controlled pointer, replaces many of the usual functions of a keyboard.

Apple's new top-of-the-range 16-bit option will go on sale in the UK some time in later summer. The complete package — 'mouse', keyboard, processor, display, twin floppy-drives, single hard-drive, and the range of integrated software is expected to cost in the region of £8000.

In the same week as Apple's announcement, IBM has chosen to launch its Personal Computer in Europe.

Starting at £2080 the basic machine with 64K Ram, single 160K floppy-drive, keyboard and monochrome monitor, is the smallest and least expensive IBM system.

The machine will be manufactured at a new IBM plant in Greenock. The decision to build IBM PCs in Scotland will create up to 400 new jobs.

Sinclair worth £135.9m

FOLLOWING the successful sale of 400,000 Sinclair Research shares — 10 per cent of its equity — to a group of city institutional investors, the company is valued at £135.9m.

The sale makes Clive Sinclair's 95 per cent share of the company worth £129.1m.

The £12.7m. realised by the share placement will go to Sinclair's electric car project which now requires additional funding. Clive Sinclair explained the decision: "I believed it inappropriate for Sinclair Research to fund this project further because of its long-term nature".

The company, heading for pre-tax profits this year of £14m. is to seek a listing for Ordinary Shares in the "reasonably near future".

Pro Joysticks

THE new self-centering Competition-Pro joystick by Coin Controls is now available for the Spectrum from Kempston Microelectronics.

The unit has eight directions and two fire buttons.

The joystick costs £26 including post and packing from Kempston Microelectronics, 180a Bedford Road, Kempston, Beds.

Versions are planned to operate with the Vic20 and Atari machines. Further information from Coin Controls, New Coin Street, Royton, Oldham, Lancs.

Pixel merger

PIXEL Productions, the London-based ZX81 and Vic20 software house has appointed Quicksilver to market and distribute its cassette tapes.

"Pixel's material will continue to be marketed under its own banner but Quicksilver now has exclusive distribution rights in the UK," says Pixel's Joe Gillespie. "The business is going so well I found I couldn't cope" he explained. "I intend to carry on writing software."

DEMON Machine Code Monitor for DRAGON Computer

What is a Machine Code Monitor?

A monitor is a program which allows access to the low level functions of a computer. Normally a good monitor will allow access to the memory contents and the microprocessor registers as well as the ability to run programs written in machine code. There should be an accessible library of documented subroutines which can be used for developing programs around the monitor.

What can DEMON do?

DEMON has twelve commands:

1. A — Adjust the Microprocessor registers
2. B — Set breakpoints (up to 12 breakpoints are allowed)
3. E — Examine memory in either Hexadecimal or Ascii mode
4. F — Fill memory between two addresses with a constant value
5. G — Restart a program from the program counter value
6. J — Restart a program at the supplied address
7. M — Modify memory contents
8. O — Memory test
9. R — Register dump
10. V — Relocate Video text page
11. X — Clear breakpoints
12. Z — Return to BASIC

DEMON does not affect the normal running of BASIC and can be accessed at any time from BASIC. There are fully documented subroutines which allow keyboard input and output to a text page, relocation of video text pages and other useful routines. DEMON subroutines are totally self-contained.

A 6809 instruction summary is supplied with every copy of DEMON giving full details of all the instruction opcodes and their meaning as well as a programming model of the 6809 microprocessor.

The powerful interrupt handling in DEMON allows programs to be easily developed and checked in machine code.

All subroutine entry points are grouped in such a way that DEMON will be fully compatible with other software due to be released by COMPUSENSE.

DEMON — available from COMPUSENSE or any good dealer price £18.40 including postage.

Order by cheque or ACCESS/VISA by telephone or post.

C★TECH SOFTWARE

Is this the end of

LETTERS

Down to earth with a thump

Re Monkey Puzzle, November 18, page 35. Boris Allan's reply to S Kane on this topic (*Letters*, January 6) is clearly incorrect.

If, initially, monkey and stone are balanced on either side of the pulley and the monkey succeeded in raising the stone, it would require that an additional length of rope be transferred to the monkey's side of the pulley. Monkey and stone would therefore not rise at exactly the same rate as stated by Boris Allan. As soon as the stone began to rise, the two sides would no longer be in balance due to the excess weight of rope on the monkey's side. The monkey would therefore come down to earth with a thump on his rump.

And all that is leaving aside the question of whether the monkey actually will manage to move the stone...

David Bullimore
Cloverley Villa
Daw Lane
Horbury
West Yorkshire

Personally, I feel sorry for the monkey who has been variously described as climbing to the top of the rope, raising the stone to the top of the rope, causing both himself and the stone to rise to the top of the rope and now falling to the earth on his rump. To spare him any further indignities I suggest he be left in peace, wherever that may be.

Can someone help on Tandy?

Does anybody know whether the Tandy EDT/ASM 6809 assembler cartridge will work with the Dragon 32? I know that a number of the Tandy cartridges do work on the Dragon as do some of the machine code cassettes (specifically *Bedlam*, the adventure game).

It seems that anything requiring access to the printer port will not work. The machine code screen dump program available from Tandy does not work, as I know to my cost, so it seems likely that the word processing cartridge *Color Scipsit*, which probably utilises similar subroutines, cannot be used. Therefore, does anybody know of any

word processing programs for the Dragon 32? I am not looking for *Wordstar* capabilities, just something for routine correspondence.

Here's hoping that you, or someone 'out there', can help.

Freaked out on Horace

Your review of Spectrum games in the January 6 issue was very informative. I have several of the games that you tested, and, like you, I am addicted to *Hungry Horace*. That is, I was!

I have now found the secret of the game, and my best score has jumped from a nail biting 8,970 to a totally relaxed 44,000, and a score of 100,000, or 'off the clock', is quite possible.

I will not divulge the flaw which allows you to cheat so easily, for fear of leaving other *Horace* freaks as miserable as myself.

Life has lost all meaning for me, now that *Horace* has lost its challenge. Keep reviewing the games so that perhaps I can find a replacement.

David Pountney
105 Coningsby Drive
Kidderminster
Worcs

Having played *Hungry Horace* a few times myself, I must admit that my score fell well short of a nail biting 8,970, never mind a totally relaxed 44,000. I do not know if any of our other readers have found a flaw in *Hungry Horace* — I certainly have not.

If it is any consolation, you can now purchase *Horace goes skiing*, a sequel to the original *Horace* program. Written by Psion, in conjunction with Melbourne House, this program will run on either a 16K or 48K Spectrum. As far as I know, it has no flaws.

16K rammers in the majority

The only statement which comes to mind when reading J Ashbourne's statement (January 6 issue), that "16K Rammers" are in a minority is "preposterous balderdash".

Many of my schoolmates have ZX81s, all 16K. The number of firms manufactur-

ing 16K Rams eg Memotech, JRS, Ground Control, Uncle Clive etc, are very high. How many schoolkids or adults want to pay out for a 32 or 64K Rampack? I'm sure that a poll would prove us so-called "16K Rammers" in a majority.

As for Mr Ashbourne's m/c compiler, I suggest he makes sure a program fits his needs before he buys it.

Mathematical patterning

I enclose a short Spectrum program that produces a pleasing mathematical pattern that readers might like to run:

```
10 FOR X=1 TO 175 STEP .15
20 PLOT COS X*X, SIN X*X
30 NEXT X
```

I must also thank you for producing such a good computer magazine, though I must admit to one gripe — the number of letters printed that refer to Spectrum bugs (three in Vol 2 No 1) I feel is excessive. A minority sport I would have thought, with dubious usefulness to most Spectrum users. Could we call it a day on bugs please.

At your command

I refer to David Nowotnik's article in today's issue of *Popular Computing Weekly* (January 6). The program on page 24 (fig 2) contains two bugs. First, the loop variable in lines 210 to 230 should be y not j. Secondly, the *Data* statement (line 130) contains one too few entries (ie only 23 instead of 24 as required by the *Read* statement (line 110)).

I would very much like to be able to *Peek* and *Poke* the ZX Spectrum display file, and I would therefore be pleased if you could publish the corrected program.

L A King
82 Tedder Road
Acomb
York YO2 3JF

You are quite correct. Line 210 should start *For y=190* — not *For j=190*. Line 130 should read:

DATA 6,0,62,0,230,7,79,201,6,0,62,0,230,56,79,201,6,0,62,0,230,192,79,201

Auto-repeat on Dragon

In reply to Peter Chase's request for other ways to get repeating keys on the Dragon (*Popular Computing Weekly* December 30), I would like to submit the following routine. It utilises the location 337 to give auto-repeat on certain keys. The subroutine prints a square on the screen. If you press 1 the square moves to the left and if you press 9 the square moves to the right.

I think this subroutine may come in useful if Dragon users would like to move a "bat", as in a break-out type game, or if they would like to add variety to their programming by not having to use *Inkey\$* like most people:

```
10 RS = CHR$(143)+CHR$(128)+CHR$(143)
20 x = 430
30 PRINT @ x, RS
40 IF PEEK (337) = 253 THEN X=X+1
50 IF PEEK (337)=254 THEN X=X-1
60 GOTO 30
```

Rectifying bugs

After purchasing my Dragon at Christmas, I was horrified when I started reading the manual. The first program I read had a bug in it.

Having gone through the manual, I have found a bug in most of the programs. Some bugs were typing errors and some just the logic of the program. Most of these bugs can be rectified if you have had previous experience of using the Basic language, but if you know nothing about Basic and just type in the program, it can be very disappointing to receive an error for your efforts!

I have also discovered the true amount of memory you have left. I worked it out with the aid of the following program.

```
10 LET A=MEM/1024
20 PRINT "YOU HAVE":A;"K OF MEMORY LEFT"
```

Computer Surround

A new game for Spectrum by D Oxley

This game entails manoeuvring a representative figure of a man around the screen, while avoiding green blocks as they appear. You score points by covering as much of the screen as possible, and by directing your man to hit a blue flashing square. The game ends if your man hits a green block.

There are four levels of difficulty. To move around the screen use *Q* for Up, *Z* for Down, *I* for Left and *P* for right.

If you hit a special harlequin black and blue flashing square, the screen clears and you move up one level of difficulty.

The only strategy to the game is staying alert, not making too hasty a move, and avoiding being hemmed in.

Program notes

Line	Function
8	Input " " sets input lines to <i>Border</i> colour.
10-70	Set up user-graphics by a simple and easy method.
110	Tells computer to wait until you press a key.
120-130	<i>x1</i> and <i>y1</i> are directions for player movement and also make sure that you stay on the screen.
140	Checks if you hit a green block.
145	Checks whether you hit a 'graphics 6'. If so, increases score and difficulty and clears screen.
150	Checks whether you hit a flashing blue block.

160	Erases old position; uses logic to print correct figure at new position.
200-250	For each level of difficulty, the computer tries to print a green block around the player position.
260	Possibly prints a 'graphics 6'.
400-430	Sound end of program and print mini-explosion.
435	Does a loop of <i>Out (Fe)</i> , <i>n</i> to produce random border and clicks.
500	Sound for hitting a flashing blue block.
510	Changes blue block into green block.
520	Increases score by 100.
1000-1130	Instructions
1200	Define a random number function.

John Hollis, Quicksilva's Technical Director.

Games designers are rare

David Kelly talks to John Hollis, Quicksilva's software wizard, about the art of programming.

John Hollis is Quicksilva's Technical Director. Since first becoming involved with the company some 18 months ago — designing hardware add-ons for the ZX81 — John has gone on to become Quicksilva's chief programmer.

As the company has concentrated more and more on software and phased out its hardware activities, so John has given up design in favour of programming. It seems to be a switch he favours.

"The company started when Nick (Lambert) designed a 3K Ram pack for the ZX81. At that time I was working as a hardware engineer designing business systems," explains John.

"I had known Nick from years back — we are old buddies. Anyway, I got involved when Quicksilva did the ZX81 colour board — I got that working. Then we followed that with the Character Generator and the Hi-res Graphics Board. At the same time I did my first software — *Asteroids* for the ZX81 — and the Rom for the Hi-res board.

"Everything was going fine until the ZX Spectrum came out. We were actually on the point of launching a machine of our own using the Hi-res and Colour boards — we had even found a company to do the Basic.

"When the Spectrum was released, Nick and I decided that Quicksilva must concentrate on either hardware or software. Since the Spectrum provided most of the facilities that we had been trying to give the ZX81, it seemed sensible to concentrate on software."

John joined the company full-time in April last year and has been writing software steadily since then. First he did *Intruders* for the Spectrum and then *Meteor Storm*, *Speak Easy* and most recently *Time Gate*.

At the moment Quicksilva has about 10 programs in its catalogue — of which John

has written about half. All that is about to change.

"We wanted to do software for other machines," he says. "At the end of last year we advertised for software programmers who could write for the Vic, Dragon, BBC and Atari machines. Now we have two or three programmers for each of these machines our output should shoot up dramatically — the first of the new software comes out in February with new material for the Vic20 and Atari machines."

Increasing the number of programmers writing for us has given John more time. "Up until *Time Gate* I had my hands tied as far as writing was concerned. Nick thought Quicksilva should first build up a solid catalogue of quality versions of arcade favourites. It is always a problem — until you have established a reputation for good material you cannot do original software because people want to be sure of what they are buying.

"As far as possible, Quicksilva will now be concentrating on original game designs. Of course, original games take somewhat longer to develop, but I can now afford to take more time writing programs. Something like *Intruders* takes about a month to write. *Time Gate* took nearer 2½ months. Now that we have more programmers they will provide a steady flow of software while I will be able to concentrate on the more involved games.

"I'm a Z80 fiend. I have programmed the 6502 and 6809 processors, but I prefer the Z80. So, for a while I shall be sticking to the Spectrum, though the Lynx is looking attractive. What I want to do is produce four or five 'special' games a year. The next one will be better than *Time Gate*. You always have to do better than before, and you are always learning.

"With *Time Gate* I learnt how to do 3-dimensional graphics. It also has a

strong story element to it and it plays a lengthy game. One of the things I'm most interested in is a kind of Adventure/Arcade hybrid.

"The way in which a game is written is planned quite carefully — pretty early on in its development it is decided if it will work as an idea or not. If an idea is no good, it is quickly shelved.

"In a way, *Time Gate* arose out of a need of the company," says John. "We wanted an extra special program.

"It took about a week to put the ideas together. I usually start with the screen layout and the story line. It had to be 3D, but better — 4D. That's where the *Time Gate* idea came from. All of us here read a lot of science fiction and when I told Mark (Eyles) about the ideas he helped develop the plot.

"Having got a static display written in Basic, just to see what it looked like on the screen, I then tried to get it to move. The main problem was the stars — it was a question of looking in books to find out how the illusion of 3D works. You always do the most difficult bit of a program first — that way you find out early on if it is going to be impossible to write the game.

"I first tried moving the stars out linearly from the centre of the screen — that gave the impression of them moving more slowly at the outside of the screen. I tried several ways of speeding them up at the edges but none of them was right.

"I'm a very poor mathematician — I failed 'O' level — but if I really have to find something out, I find out! After I had suffered with the maths book for a while, I realised that what I needed was a cosine rule. I reckon it was the first time I'd used cosines!"

When John discovered that it was quite straightforward to finish the program he worked out a table of cosine values which the program uses to plot the stars.

"One other strange problem I found was, if all the stars started at the same point on the screen, it gave the illusion that

someone was throwing them at you. I got round that by having them generated around a central point, with a random element. When I incorporated that into the program it suddenly worked — the illusion of moving through space was there.

"Once that was done all I had to do was get the console working and build in the *Time Gate* and the Planet Landing routines.

"Everyone at Quicksilver is surprised and pleased at the response to the game. It is now selling in greater numbers than all the company's other games put together!

"Since I finished *Time Gate*, I haven't had time to do any coding. I needed a rest after completing it and then there was Christmas, but I have designed three more games and I shall start coding next week. You should see something out of me in the next month or two!"

In John's view, a good game should make full use of the computer hardware of a particular machine. "If its got hi-res and sound then you must use them. Most machine-code games have a delay loop in them to make them slow enough to play. You can easily use that time to enhance the sound or graphics of the program.

"The Spectrum just has the *Beep* sound command. If you want good sound you can use the spare computer time to generate good sound effects built up using software. Alternatively, you can use the time to move the display graphics pixel by pixel, rather than character-square by character-square."

He says that, for a game to be successful, it must be possible for a beginner to play, yet it must get harder as the game goes on, making it difficult for an expert to play.

"Hard-core arcade game players like Nick — he has his own *Defender* Arcade machine — like one sort of game and that may not appeal to everyone.

"Personally, I loved the film *Tron*, it was excellent — that's the sort of feel a program should have. A large part of the film was done using animation techniques rather than computer graphics, but I think that is the sort of thing one should be aiming for. I know you cannot get those sorts of effects on the Spectrum, for example, but by squeezing performance out of a machine you can do a lot!

"One of the most important things you can do is prepare yourself with the proper software tools before you begin to code. The first thing we did when we got a Spectrum was to write a library of sub-routines as program-writing aids.

"When I'm coding I use a modified Nascom II with a whole range of assemblers, disassemblers, monitors and debuggers on it. Nobody in their right mind keys in machine-code direct. Although I write on the Nascom I never run it on there — I transfer it across to the Spectrum. That way if it crashes I don't lose the program.

"Software, if you write it properly, has the ability to 'bootstrap'. You use the first bit you write to help you write the next bit which helps you do the next bit and so on

— you should never have to write anything twice. If you have to write any machine-code in direct, then you should write an assembler.

"When we did the Rom for the Hi-res board, I had to write a line interpreter. From the computer's point of view, a good internal language interpreter looks a little like Forth. For an internal representation in the computer it is excellent, but in terms of the user it is a step backwards — people just don't think in Reverse Polish Notation!

"Maybe the biggest problem with writing

a program is to convert what is in your head into machine-code." The sub-routine library that John has written for the Spectrum is common to all Quicksilver's material. In a way it buffers the programmer from the hardware with a couple of K of code. All Quicksilver's programs are built up from scratch.

"The one cardinal rule is never to call anything on anybody's Rom — none of our programs use any of the commands in the Spectrum's Rom, for example. The reason is quite simple — if the manufacturers change the Rom then your program suddenly won't work. It happened to us once with the ZX81 — never again."

The sort of thing that John's sub-routine package does is to set up the colour attributes of a particular character. It also sets up the object descriptors. These tell

the computer if a particular character is an enemy, for example, and they also give information about which way and with what speed it is moving across the screen.

Quicksilver's programs are all built up from the same basic core of code — very similar to the way in which adventure games like the Scott Adams Adventure Series are all built up around the same basic program. "There is really, as far as the programming is concerned, very little difference between *QS Intruders* and *QS Meteor Storm*," says John. "The two main differences are the character sets and the object descriptors.

"The problem with games writing is that a lot of the best programmers couldn't design a game to save their lives — good games designers, as opposed to programmers, are very rare. I have a sneaking suspicion that some of the first class games designers may not even have a computer.

"As far as Quicksilver's plans for expansion go, our aim is to link games designers with the right programmers for their style of presentation. This is very similar to the way some American games houses work — they develop games in teams of two — a designer and a coder."

Quicksilver has taken on new programmers simply because of the number of machines now on the market, each of which has different software requirements. "This is the single biggest problem for a software house: every time a new machine is released everybody reinvents the wheel with the software. Software must be one of the few industries which cannot build satisfactorily on what has been done before — and as long as this state prevails it is difficult to see how software development will progress.

"My dream, if you like, is a system to make software machine-independent — to be able to write a program on one machine and instantly transfer it to run on any other machine — regardless of processor.

"I have worked out how it could be done — but to actually carry out my idea you would need a team of ace programmers working for much, much longer than we could even begin to contemplate." ■

Dragon fun

Keith and Steven Brain look at a selection of software now available for the Dragon.

Father Christmas arrived early, when a parcel of Dragon 32 software arrived for review on Christmas Eve!

As usual, the standard of the packaging and instructions varied widely. Fighting off our desire to get straight into battle with the Klingon Empire, we started with those cassettes offering a number of short programs (*Dragon Games 1 and 2*, *Dragon Fun and Games*, *Dragon 32 Cassette One* and *Games Pack One*). Four of these cassettes contained Basic programs, but *Dragon Games 2* was in machine code and we therefore considered it separately.

The best of the other four tapes is *Dragon Fun and Games* from Shards Software. The programs are user-friendly, with detailed instructions at the start and extensive use of the Dragon hi-resolution and sound capabilities. *Noughts* is the old favourite, noughts and crosses, on two levels. Our only complaint is that on level one you cannot lose, but on level two you do not seem to be able to win. *Brain* is a text-only, word-guessing game, of the Mastermind type.

Gold uses a joystick to manoeuvre through a minefield to recover bags of gold. It is quite difficult to avoid the mines — gold can only be collected if you are centrally above it. *Snap* is a computer version of the old card game, with nice hi-res displays of the cards. *Anagrams* requires you to solve anagrams of five town names, which are chosen at random from a large selection. If you are stuck, there is a neat shuffling routine which rearranges the letters continuously for you.

Donkey is a clever implementation of the children's party game, but in this case the tail is moved with a joystick (while blind-

folded of course). You are guided by a rising tone towards the correct position. Very nice graphics — even horse-mad sister Katherine appreciated this one.

Dice is a poker-dice type game with good use of low-res graphics. *Circles* fills the screen with lettered circles of different sizes and requires you to pair them up — a lot more difficult than you think, especially at Christmas.

Artist is rather an abstract name for a program which randomly generates "art" according to your general instructions, and then has the nerve to let the computer judge your masterpiece!

Musical is a clever update of musical chairs, which plays a music cassette via the motor on/off function. Further features are a changing coloured display and the option of letting the computer keep track of who is left in the game. A great hit.

Altogether a series of well thought-out programs made better by professional presentation and full use of Dragon facilities. Good work by Shards Software and well worth the money at £5.

In the middle of the road in this category come *Games Pack One* from Gem Software and *Dragon Games One* from J C Morrison. *Games Pack One* seems rather expensive at £7.95 for four games, but we noted that the individual authors are credited and suspect that the royalties have to stretch a long way.

Space Wars, from *Games Pack One*, is very simple and slow and the hi-res display is lost during movement. *Sheepdog* is much better, with a continuous hi-res display of Lassie and her three sheep which must be herded into a pen. This is quite addictive, if rather difficult, as the dog has a mind of its own and does not always do what you expect. A pity that the dog cannot bark — a display of elapsed time would also add interest.

Torpedo is a good game which puts you at the periscope of a submarine, ready to fire at passing ships. Good use of sound and graphics, especially when you manage to hit a ship!

Snake is well presented, using low-res graphics, sound and a joystick. The object is to collect food, which appears at random, without eating yourself or hitting the walls. It starts off easily, but as you grow it becomes more and more difficult for you to manoeuvre.

Dragon Games One offers five games for £5.75, four of which are old favourites (*Othello*, *Breakout*, *Awari* and *Moonlander*). The programs tend to assume the user already knows how to play — more instructions would be helpful.

A nice point in *Othello* is the query whether a black and white tv is in use, in which case the display is altered to make the pieces more visible. *Lander* uses low-res graphics and is quite simple, but not bad for a Basic version.

Best game on this cassette is *Raffles*, in which you must find objects in a dark room without being detected. Very difficult to escape if the dog wakes up!

Video Productions' *Cassette One* gets the booby prize, perhaps the best part of this cassette being the *Index* program at the start which continuously scrolls the instructions. *Earth Defence* is a very basic Space Invaders-type program. *Bars*, *Crosshatch*, *Swpshp*, *Moire*, *Circles*, *Circol* and *Spiral* are all simple pattern generators which could easily have been incorporated into a single program. It seems rather cheeky to call *Swpshp* a program when it consists of six lines, three of which are a copyright (!!!) statement, one clears the screen, and the other two could easily fit in a single line (which looks very familiar to us anyway).

Titles is only a labelling subroutine, which crashes if you input more than 32 characters. *Visibubble* demonstrates simple sorting, but does not explain what is happening. To describe *Musical Keyboard* as an organ is a gross exaggeration as it is very limited, not to mention tone deaf.

DONKEY (SHARDS SOFTWARE)

The rest of the cassette contains "utility" programs. *Photo* calculates depth of field, but a pocket calculator would be just as useful and a lot easier to carry. *Motoring Costs* may be useful, or at least frightening, but *Tachograph* is really only a demonstration. *Reactance* is a very specialised program for calculating component values for filter circuits and seems out of place. The *Surprise* program at the end is a vast disappointment, merely displaying the company name ad infinitum in large coloured letters — perhaps in an attempt to indoctrinate the user.

Cassette One has recently dropped from £4.95 to £3.95, but even at that price you would do better looking at readers' programs in computer magazines.

Dragon Games Two (J C Morrison) is in a different class altogether. All three programs on the cassette are in machine code. They are of arcade standard, very fast, with excellent graphics and sound, and very addictive. Any single one of these is worth a fiver, so £6.95 for all three is a bargain.

Snakes must be killed by shooting them in the head before they catch you, but if you miss your problems multiply very fast. We found difficulty getting this program off the computer. Little brother Nicholas (8) has one complaint — if you kill more than 666 snakes in one go, the counter resets to zero, so no one will believe how good you are (but at least it took him an hour or so to reach that score).

Lander looks simple but is actually very difficult, with excellent explosions coming via direct access to the SAM chip. *Invaders* has everything you could want, including, we discovered, a way of cheating to impress your friends (try moving left off the screen before you first shoot and you will find you have developed immunity to alien fire). These programs are loaded by *Cloadm* and started by *Exec7700*, so they

GOBLIN CAVES (APEX TRADING)

cannot be stopped or copied. This was one of the few cassettes we had no problem loading, but we trust that tape corruption will not occur to spoil our enjoyment.

Moving on to adventure-type games, *Taipan* (Jaysoft) is a version of the common trading theme which puts you in the China Sea. The basis of the program is OK, and even has some educational value, but it suffers greatly by comparison with the others as it is text only. We noted that ZX81 and Spectrum versions are also

available, and assume that this is why graphics have been avoided. On the other hand, at only £4.95 it is not expensive and there is no reason why you could not dress it up with some of your own graphics. Sum Yan the moneylender is supposed to be the bad guy, but to us he seemed more like the listening bank.

Goblin Caves (Apex) introduces a hi-res graphics display of caves into the adventure, but the actual program possibilities are limited. All of the caves look much the same, except that the colour changes sometimes, and your nasty end is signalled only by a text message and some noise. Again, you cannot expect too much for £4.95, but we feel most users would be happy to pay a little more for something more substantial.

We were also worried by the great difficulty we had in loading this program. Not only were there numerous I/O errors but also, when loading appeared to have been successful, minor bugs in the program appeared, presumably due to data corruption. We may have been unlucky with our tape, but we would advise readers to check on loading before buying.

Dragon-trek, contained in a neat, custom-made, plastic box and with a detailed 16-page flight manual, was the best presented package we reviewed. It requires one joystick, and also keyboard entries. The manual warns you that this is a real-time program — so tea-breaks are at your peril.

The game is rapid, with excellent use of two alternative hi-res displays. It offers many different skill levels, with a range of possible decisions at each point in the game. For example, how much energy should you put in your shields, and is a low-energy (but slow) photon torpedo a better bet than energy-expensive phaser fire?

As well as the Klingon menace, there are super-novae and black holes to avoid, and you must ensure that you reserve enough energy to get back to a starbase to refuel. The damage report is an excellent feature, especially as your main display malfunctions if the computer is damaged. Better death than surrender, unless you fancy being demoted to the USS Faerie Queen. Altogether a first-class package. At £9.95 it is a little expensive, but still highly recommended.

The last item was something completely different, the *Demon* Machine Language Monitor cartridge from Compusense. This allows you to gain control of the system, and eventually write and debug your own 6809 machine code programs. It is compatible with Basic and, in addition to the cartridge area, only occupies memory 0600-0800 (for the *Demon* video display) and 0800-0900 (for *Demon* reserved locations).

It has 12 commands which allow you to examine and change memory, examine and change CPU registers, set breakpoints and run programs. A number of useful subroutines within *Demon* can also be incorporated into your own programs. A 16-page manual, and a Motorola 6809 instruction set summary are included.

Although a few examples are included in the manual, the novice needs a lot more information before being able to use machine code. The monitor was easy to use and is a useful tool for those who have conquered Basic and want to move on to the heights (or is it depths?) of machine-language programming. It has the advantages over tape-based monitors of using minimal memory and being instantly available, and is reasonably priced at £18.40.

Our general impression of this sample of independent software is that some excellent material for the Dragon is becoming available, but that the user must ensure he is not buying a pig in a poke.

DRAGON PROGRAMS

MONSTER MINE by W. E. MacGowan

Escape from the mine with as much money as you can, but don't get closed in or caught by the prowling monsters. An addictive machine code game, with superb graphics and save facility. £7.95

GOLF by Pete Allen

Over 20K of Basic giving you full 18-hole golf course with handicaps, choice of clubs, golfing weakness must be specified, full colour graphics and sound including score card. £7.95

GAMES PACK 1

Space Wars by John Line. Torpedo by Erik Pattison.
Sheepdog by Erik Pattison. Snake by Christopher Hunt.
£7.95

GAMES PACK 2

Landing by Peter Chase. Hangman by Christopher Hunt.
Speedboat by Peter Chase. Battleships by C. A. Castle.
£7.95

CHARACTER GENERATOR by John Line

Create and use your own symbols and character sets on the Dragon's high resolution graphics screens. Written in Basic for ease of use, comes with complete ASCII character file and demonstration program. £9.95

★ NEW ★

GAMES PACK 3

Reversi by Dr R. J. Fryer. Try to beat the Dragon at this fascinating board game. From novice to grand master. Pontoon by Christopher Hunt. Play this favourite card game with the Dragon as the banker. Incredible graphics and sound. £7.95

SPACE MISSION by W. E. MacGowan

Launch from Lunar Base, fight your way through the meteor storm and battle with the alien fleet in deep space. Multiple skill levels and the best graphics ever. £7.95

OPEN FORUM

Open Forum is for you to publish your programs and ideas. Take care that the listings you send in are all bug-free. Your documentation should start with a general description of the program and what it does and then give some detail of how the program is constructed. We will pay the *Program of the Week* double our new fee of £6 for each program published.

Music

on Jupiter Ace

To start the music program, you must define a variable to set the length of the notes. In this program all notes will be the same length. The variable *Qua* will be used:

```
200 VARIABLE QUA
```

Now you can define the word, *Music* as:
DEFINER MUSIC, DOES> @ QUA @ BEEP;

This enables you to store the data for the notes in a very efficient way. Now the boring bit — the data is put in as variables thus:

```
478 music C
426 music D
379 music E
```

```
358 music F
319 music G
284 music A
268 music BB (stands for B flat)
239 music C+ (an octave above the other C)
213 music D+
201 music EB+
179 music F+
190 music E+
```

You can of course define further notes, but these should be sufficient for an example program. Next, a word *Part 1* is defined:

```
: PART1 F G A C+ BB BB D+ C+ C+ F+ E+ F+
C+ A F G A;
```

Next a word *Part 2*:

```
: PART2 PART1 BB C+ D+ C+ BB A G A F E F G C
E G B B A G;
```

And a third word:

```
: PART3 PART2 A PART1 D C+ BB A G F C F E F A
C+ F+ C+ A F A C+;
```

The word to run this demonstration program is *Bach*;

```
: BACH PART3 179 QUA @ 3 * BEEP;
```

Typing in *Bach* should now run the program. If any problems are encountered then a word *Scale* should solve them.

```
: SCALE C D E F G A B C+ D+ E+ F+ SCALE;
```

which is a clever way of producing an infinite loop (instead of *Begin 0 Until*, as suggested by the *Ace* manual) by getting the word to call itself. *Scale* just gives a repeating scale of notes (until you press *Break*, so not use *Fast* mode) so you can decide if a note is badly defined.

This method is more efficient in memory terms than that suggested by the manual and is a useful addition to games. The words can be used inside words as well as in immediate mode.

The program can be slowed down to a more sedate speed by

```
300 QUA 1
```

which resets the variable *Qua*.

Music

by Martin Sudworth

Graph

on BBC Micro

When data is presented in numerical form, it is often hard to comprehend. Displaying these numbers graphically is much easier to understand. This procedure is extremely useful as it accepts any number of arguments (floating-point and negative), scales them, and plots them on a grid in the form of

a graph. A title, and two labels (for the X and Y axis), are displayed and positioned on the screen automatically. When both negative and positive numbers are used a line is drawn to show the zero mark.

Before calling this procedure the machine must be in *MODE1*, also an array *A()* has to be set up containing the necessary data for the graph. There are four variables which have to be passed

when called, the first (*T\$*), is the title, the second (*XL\$*), is the label for the X-axis, the third (*YL\$*), is the label for the Y-axis and lastly (*D%*), the length of the array.

Line 1010 makes the variables local, so that if similar names are used outside the procedure, they will not be affected.

This procedure is for the BBC Model B; by using *MODE 4* and changing all colours to white, it will run on a Model A.

Escape Maze

on Atari

This game will run on either the 400 or 800 with 16K and with the Basic cartridge. The aim is to escape through all three mazes. There is full use of the graphics and sound.

Program notes

Add the following lines if you want *System Reset* to restart the game.

```
0 POKE 2,0:POKE 3,6:POKE 9,2:POKE
1536,76:POKE 1537,64:POKE 1538,185:TRAP 17000
17000 RUN
```

```
9 to 65 Commands for first maze. Gosub 2000
```

Graph

by Neville Thomas

reads *Data* lines (12-18) to draw maze. *Gosub 9000* (-9090) gives joystick commands which control the moving pixel. These commands are same for mazes 2 and 3 also. Line 9000 specifically gives time limit for all 3 mazes. Line 62 tests x,y co-ordinates for the invisible walls which if positive sends pixel back to start. Line 63 tests to see if pixel is at door of first maze. Line 64 with *Gosub 7000* tests for pixel hitting wall (if positive *Gosubs 1000-1010*);

Gosub 16000 records number of wall hits. Line 65 draws pixel with colour 1 while followed by colour 3 so as not to leave a trail.

3000 to 4020 Graphics and sound commands for escaping first maze.

4090 to 5180 Commands for second maze. Line 5157 is a test for sending pixel through to the third maze. Line 5159 with *Gosub 14000* tests for pixel hitting wall. If positive *Gosub 13000-13010*

HUGE SELECTION—STOCK NOW EXCEEDS 500 TAPES!

HIRE ZX81/SPECTRUM PROGRAM TAPES

Make the most of your computer by hiring from the original
and still the only software library offering all these features:

- Over 500 cassettes which include many of the best advertised in this magazine—arcade, adventure, 3D, utilities, toolkit, graphics etc etc.
- Full-time staff of three offer you a friendly, efficient welcome & service
- FREE quarterly, illustrated magazine packed with interest, posted to all members.
- Up to 25 maker's originals of each tape to ensure good service on even the most popular programs
- A reliable, personal service by fellow enthusiasts anxious to help you
- Descriptive catalogue helps you choose the best tapes for your needs.
- A fortnight's hire for £1
- Join on a month's money-back approval—satisfaction guaranteed!
- "An exceptionally professional and thriving organisation"—review in Eric Deeson's "Guide to ZX Spectrum Resources".

SOFTWARE LIBRARY

Warren Road, Liss, Hants GU33 7DD.

Yes, please—I'd like to join for the next 12 months. Please send on money-back approval my magazine, descriptive library catalogue and order forms, on the understanding that if I'm not delighted with your service within 28 days you will refund my money in full.

Escape Maze
by G C Roberts

Board Game

on Dragon

This program is a two-player game of four in a row for the Dragon 32.

The computer has no part in the program except to display the board of a 1 to 7 and A to K grid. In order to place a piece just enter 3A or A3 and that block will be painted in blue. On the next entry 4A a second colour yellow will be painted.

It would be up to the player with 4 of his/her own blocks in a row to declare a win. To restart a game press the 'X' key, and to end the game press the 'V' key.

Program notes

80 Sets screen
90 to 160 Draw the grid and paint the border
170 to 240 Numbers 1 to 7
250 to 360 Letters A to K
370 to 520 Instructions for next game
530 to 540 Set Flags
550 to 740 Input 1 to 7 and A to K
750 to 800 Paint block and reset flags
810 to 920 Instructions

PROGRAM OF THE WEEK

Board Game
by Paul Hill

Vardump

on Spectrum

This program, in Basic, for the ZX Spectrum, will list out all the variables from the variables area. The values of string and numeric variables and for-next counters are listed, but only the size(s) of each dimension are listed for string and numerical arrays, although a simple modification could remedy this.

If after running a program, Vardump is merged followed by a command *Goto 9980* all variables will be listed in the order they were defined. (Run will of course erase them.) The few variables used by Vardump will be listed last, unless any were used by the main program, in which they will appear earlier in the listing, but displaying the current Vardump values.

The programming effort required to avoid using any variables was not considered worth the effort, although a machine code program would of course have achieved this. A simple modification could list the output on the printer.

The variables used are:

xxx address in variables area. This points to the last byte in the variables area at the end of the dump.

xx byte in address pointed to by **xxx**.

h For-next count used to step through arrays.

z\$ Holds name of variable for names more than one letter.

Note that the program uses both *Va/* and *Vals*. If more variables are defined after Vardump is used then they will appear in the listing after Vardump's variables. A typical dump is shown.

The program is not really suitable for

conversion to other machines because it is tailored to the Spectrum functions and variable storage.

Line 9981 Set *zzz* to start of variables area.

Line 9983 End of variables area if *zz=128*.

Lines 9984 to 9989 Determines single letter numeric variable, variable of more than one letter, variable array, for next loop, string and string array respectively.

Lines 9990, 9991 determines name of numeric variable of more than one letter.

Note that while debugging the program, an additional line inserted between 9989 and 9990 containing

'PRINT "Error": STOP'

will prevent the program running amok if lines 9984 to 9989 contain an error.

Vardump
by D S Laurence

Car Race

on ZX81

This program is written for the 16K ZX81. It is a game that is not seen very often and so is more interesting. All the instructions needed to play the game are contained in the program.

You have to steer a "+" around a track. The track can be changed by altering lines 320-510. These lines can be deleted after the program has been run providing that you then use goto 20 instead of run. More tracks could be added if required using the same method that I have. The score is based on the number of squares you cover.

Chase

on Jupiter Ace

This program is called Chase and is fast and great fun to play. You are the inverse "A" in the middle of the screen, the enemy's guided missile is the inverse "E" at the top left-hand corner of the screen. The idea of the game is to dodge the guided missile for as long as possible.

You can move twice as fast as the missile but it can move diagonally which evens the score. You move with the cursor control keys (5,6,7,8) in the normal directions.

[A]=inverse video "A"/[E]=inverse video "E"; (I = 1)

Tail Blasers

on BBC Micro

There have been few, if any, programs published for the BBC which use the joysticks. Although the potentiometer joysticks may not be as good as the joysticks for the ATARI or the VIC, many programs are better with the joysticks.

I have written a simple game for two players. On the keyboard, two players

would be controlling four keys each, which would be rather squashed. The game itself is very simple. Just control an ever-growing line with the joysticks. You must avoid hitting the walls or your opponent. It doesn't sound sophisticated and it isn't, but it proves how simple it is to make a program which uses joysticks, and for a game less than 30 lines (excluding REM's) it is remarkably addictive and should keep you and your opponent occupied.

Although I said that potentiometer joysticks are not as good as the switch type, you can, by taking advantage of the fact that you can actually move it in any direction, do many things that you would otherwise not be able to. For example, MISSILE COMMAND would be much better with these joysticks (or TEMPEST perhaps).

Model A owners with analogue to digital converters should use Mode 5 and change the colours in lines 220, 240 and 290.

Vic Printing

on Vic20

The manual supplied with the Vic1515 printer states that abbreviated entries are not possible for the Print# command. I have found, however, that this is not true and that typing P shift R gives the Print# command on subsequent listing. The Vic Super Expander cartridge enables simple assigning of functions to the eight function keys, and the manual describes how this is done though does not say that assigning function keys in this way can be done via a program.

The following program both illustrates how function keys may be assigned in a program and also allows single key entries for the most commonly used printer commands.

READY.

```

10 KEY 1,"OPEN1,4,0"+CHR$(13)
20 KEY 2,"OPEN1,4,7"+CHR$(13)
30 KEY 3,"CMD1"+CHR$(13)
40 KEY 4,"LIST"+CHR$(13)
50 KEY 5,"PRINT#1,"
60 KEY 6,"PRINT#1,CHR$(14)"
70 KEY 7,"CLOSE1"+CHR$(13)
80 KEY 8,"KEY"+CHR$(13)
90 PRINT"J"
100 PRINT"THIS PROGRAM SETS THE"
110 PRINT"FUNCTION KEYS:-"
120 PRINT
130 PRINT"F1=OPEN IN STD MODE"
140 PRINT"F2=OPEN IN U/L MODE"

```

Vic Printing
by John Pell

```

150 PRINT"F3=COMMAND MODE"
160 PRINT"F4=LIST DIRECT"
170 PRINT"F5=PRINT DIRECT"
180 PRINT"F6=DOUBLE WIDTH"
190 PRINT"F7=CLOSE"
200 PRINT"F8='KEY'LIST"
210 PRINT"FUNCTIONS REMAIN WHEN
  THIS PROGRAM IS CLEAR"

```

READY.

THE PROGRAM REQUIRES THE 'SUPER EXPANDER CARTRIDGE AND THE VIC 1515 PRINTER. KEY 8 LISTS THE NEW FUNCTIONS AND ENABLES CHANGES TO BE MADE AS USUAL.

I CALL THE PROGRAM 'INITIALISER' SINCE IT RESETS THE FUNCTION KEYS IN SUCH A WAY THAT THEY WILL RETAIN THEIR NEW FUNCTIONS UNTIL MANUALLY ALTERED OR THE COMPUTER IS SWITCHED OFF.

ONCE RUN THE PROGRAM CAN BE DELETED.

Clock

on Vic20

This program runs on a Vic20 with additional super expander. It first asks you the correct time in the form Hours, Minutes and Seconds. It then continues to draw the clock face. The next stage of the program draws the fingers and prints the time in the top left of the screen. In line 22 I have not used the PI sign used on the Vic as the printer I used for this program had no PI sign.

Program notes

- 22 Gives the variable PI the value of 3.142.
- 25 Clears the screen.
- 30 to 40 Asks for the time, sets the colour and graphic mode.
- 60 to 130 Works out the value of TI\$ into the co-ordinates.
- 140 to 190 Draws and un-draws the fingers.
- 200 to 210 Puts the time in the top left of the screen.
- 220 Loops the program.
- 240 to 270 Draws the hour portions.
- 280 to 310 Draws the minute portions.

Clock
by R. Tinman

Battlestar

Battlestar is a computer moderated, play-by-mail, game devised specially for *Popular Computing Weekly* by Starlord organiser Mike Singleton.

The object of the game is to find the treasure vault on Knox II, one of the Empire's fortress planets located near the outer rim of the Milky Way. But to find the treasure vault you will have to beat 244 other players.

In order to limit numbers to a manageable size, we have devised a preliminary competition (see form alongside). But hurry, only the first 245 correct solutions will be entered into Battlestar proper.

Entries for the Battlestar competition will close on January 31. The solution to the preliminary competition will be published on February 3.

Prizes

- (a) The winner will receive a ZX Spectrum.
- (b) The four losing semi-finalists will each receive a ZX81.
- (c) Each of the 245 winners of the preliminary competition will receive a voucher entitling them to £10 off a ZX Printer.

Popular Computing Weekly Battlestar

To enter Battlestar, all you have to do is answer the five questions below, fill in your name, address and telephone number, and send the form with a SAE to: Battlestar, Popular Computing Weekly, Hobhouse Court, 19 Whitcomb Street, London WC2.

Rules

- a) Each entry must be made on a form cut from *Popular Computing Weekly*.
- b) Only one entry per person.
- c) Closing date for entries is January 31.
- d) The Judges' decision is final.
- e) No employees of Sunshine Publications Ltd, or their families, will be eligible to enter Battlestar.

Questions

- 1) Which actor played Han Solo in *Star Wars* and Deckard in *Blade Runner*?
- 2) Which film is the sequel to *Star Wars*?
- 3) What do the letters MCP stand for in the film *Tron*?
- 4) What are the names of the two robots in *Star Wars*?
- 5) Where is ET trying to phone?

Name SIMON BRAY
Address 40 ROCK ROAD
CAMBRIDGE
Tel. No

Answers

- 1)
- 2) The sequel to Star Wars is The Empire Strikes Back
- 3) R2-D2 and C3-PO
- 4)
- 5)

Keyboard talk

Jim Parren explains how to create a keyboard bleep while Cyril Aubry draws a circle.

This program for the unexpanded Vic20 is designed to give a bleep whenever you press a key. The machine code routine is called by the *Irq* interrupt every $\frac{1}{60}$ th of a second. This is achieved by altering the *Irq* jump address stored at locations 788 and 789.

When the interrupt is called, the processor jumps to the user machine code and tests to see if a key is pressed. If a key is pressed, then the sound generator (middle tone) is *Poked* with a note.

The note can be changed by changing the value at line 60 in the range 240-255. The volume can be changed by altering the value at line 40 in the range 1-15. The duration of the bleep can be changed by altering line 80 in the range 1-255.

You should type in the program and Save it before running. When *Ready* appears on the screen then pressing any key should result in a bleep — if not, then the machine code (lines 20 to 110) should be checked. Once the program is entered correctly, add line 160 *New*, and Save the program.

When reloaded, the program will not only auto-run, but also leave the user Ram clear. The program occupies no program memory once *Loaded*, but locates in free space (673-767) in page one of memory. This program can thus be used on any Vic.

Should you wish to remove the bleep, then press *Run/Stop* and *Restore* simultaneously. To restore the bleep type *Sys(673)*. This resets the *Irq* vector.

In the round

This program allows the use of hi-resolution on the unexpanded Vic20. It uses the Vic's inbuilt facility for hi-res

graphics. After a few seconds, the program will draw a circle (size of the whole screen). It will then make the circle vanish. I am sure that even inexperienced programmers will be able to adapt it to their own programs. It can be very useful. ■

THE ULTIMATE DRAGON ADVENTURE

Rescue from Death's Head Hole

This is the greatest adventure game we've ever handled — and we've had our hands on quite a few! Deep beneath the Mendip Hills, three potholers huddle trapped and frightened in the blackness of Death's Head Hole. Your newly-formed rescue team has barely finished mapping the Entrance Series of the pothole's network of passages when the order arrives: SAVE THEM — AT ANY COST!

It's a game that fires your imagination at every move — BATTLE against raging waters as you haul yourself up swaying wire ladders ... CLAW your way through long-forgotten earth-filled passages ... BAIL a route through still, but deadly pools ... LISTEN for the cries of the trapped trio as you snatch a few moments' rest in a quiet cavern ... DIVE through forbidding — well, we don't want to give the WHOLE game away! If you only buy one adventure game, it has to be RESCUE FROM DEATH'S HEAD HOLE!

Also: HANG 'EM HIGH, our best-selling family word game with a cash challenge — it's ideal for helping you to introduce youngsters to the wonderful world of computers.

Only from Words and Pictures
7 Hawthorn Crescent, Burton-on-Trent

Please send me for my Dragon 32:

☐ RESCUE FROM DEATH'S HEAD HOLE at the special introductory price of £4.45

Designing characters

This is the second extract from the new book, *The Working Dragon 32*, published by Sunshine Books Ltd.

Module 4: Lines 1500-1740

This module is designed to allow the user to move a flashing cursor around the grid printed by the last module, inking-in or erasing squares at will. Having satisfactorily designed a character, a variety of other program functions can be called up by the use of single-key codes.

Commentary

1550-1610 A variation of our standard 'flashing cursor' routine. The cursor is first drawn and then redrawn to the background colour of the square it occupies. The whole process cries out for the use of *Get* and *Put* but unfortunately the smallest rectangle which can be *Put* back onto the screen in this *Pmode* is twice as long horizontally as one of our grid elements.

1620 Having left the flashing cursor routine at the touch of a key, this line checks that the element which has just been redrawn to the background colour does not have to be inked-in according to the information stored in the array A.

1630-1660 These lines, as will be recognised from previous programs, move the cursor around the screen. In this case the cursor moves in four pixel steps, anywhere within the limits of the grid. As usual, logical conditions are used to control the movement and the required input is one or other of the arrowed keys on the keyboard. 1670 The 'O' key is used to erase any inked-in element over which the cursor is currently flashing. This is done by simply redrawing it the background colour. The relevant element in the array A must also be reset to zero, otherwise the square will be inked in again every time Module 3 is called up.

1680 Pressing 'I' inks in the square and sets the corresponding element in the array A.

1690 Input of 'R' rotates the whole grid 90 degrees anti-clockwise when the next module has been entered.

1700 Input of 'M' will later allow the design to be moved around in the grid.

1710 Input of 'I' transforms the design into its mirror-image.

1720 Input of 'E' extracts the string necessary to draw the character which has been created.

1730 Input of 'S' results in the string created being saved to tape. Note that because this will involve instructions being printed using the text screen, the *Screen* command must be used on return to retrieve the high resolution display.

Testing

At this point you should be able to move the flashing cursor around the grid, inking in or erasing squares at will. None of the

other functions is yet available and their use will result in an error report 'undefined line'.

Module 5: Lines 2000-2220

This module performs three of the functions called from the previous module, namely rotation, inversion and movement of the design within the grid. All the manipulations are performed by employing a second array, B, to which is transferred the data from the array A, suitably modified. The array B is then copied back into 'A'.

Commentary

2030-2050 Examination of the subscripts for the arrays A and B in the first line will reveal that these three lines accomplish

the rotation of the data stored in the array A by 90 degrees, that is to say that element 0,0 is moved to position 31,0 and so on. Having redefined the array A, Module 3 is recalled to draw the modified grid.

2060-2180 This subsection accomplishes the movement of the design within the grid. In order to understand this function it is first of all necessary to visualise the corners of the grid numbered in the following manner:

```

1 2
3 4

```

The Working Dragon 32, by David Lawrence, costs £5.95 and is available from **Sunshine Books Ltd.**, Hobhouse Court, 19 Whitcomb Street, London WC2 7HF.

Channelled drives

Andrew Pennell explains how channels can be used to transfer output between the screen and printer.

There is a very useful function in Spectrum Basic that is not mentioned at all in the manual — the use of channels. These will be used by the microdrives and networking facilities for input and output, but they can also be used for several useful effects.

The symbol for channel is the 'hash' sign, on the 2 key. There are 19 channels, 16 of which are accessible from Basic. Channels 0 and 1 are the lower screen,

channel 2 is the upper screen and channel 3 is the printer.

These can be used for *Input* and *Output* using the expected commands. For example *Print #0*; "Hello" will produce the message "Hello" on the lowest line of the screen, previously unobtainable. Any *Output* here will be destroyed by any system messages, such as 'Scroll?'. *Print #2* is the same as *Print*, and *Print #3* is equivalent to *LPrint*.

Input statements can also be used with channels, but there is no advantage in doing this until the Microdrives arrive. Incidentally, *Input #2* and *Input #3* result in error messages.

Another statement for handling channels is the *Open* command, available in *E* mode from *Shift 4*. The general syntax of this function is *Open #A,A\$*, where *A* is the channel number, and *A\$* the single

character filename. Valid filenames are *K*, *S* and *P* which are lower screen, upper screen and printer, respectively. Lower-case filenames are also accepted.

The action of this *Open* statement is to transfer all output usually sent to channel number *A* to the named second channel. For example, *Open #2*, "P" will result in all upper screen output (except automatic listings) being sent to the printer. *Open #3*, "S" achieves the reverse effect, and all *Listings* will be sent to the screen. To restore everything to normal, use the *Close* statement.

When the Microdrives are eventually released, new 16K Roms may be required. This is not a wild guess, but based on several facts gleaned from disassembling the Rom. This can best be demonstrated by attempting to *Close* channels 4 to 15, which usually results in a system crash! ■

Printing by command

Chris Wood explains how to print on lines 22 and 23 by altering two Rom addresses.

In order to print on lines 22 and 23 two addresses in Rom must have their contents altered. *DF-SZ* (23659) contains the number of lines at the bottom of the screen normally unavailable to the user except through *Input*. Address 23689 contains the address of the next line number to print on.

Poking 23659 with zero enables you to access these lines, but you still get an 'out of screen' report. *Poking* 23689 with two allows you to print on line 22 and you can even *Print At* 22,*n* where *n* is any number up to 31. *Poking* 23689 with one will put your next *Print* statement on line 23, but you cannot print *At* line 23,*n* or the computer will crash.

NB you must also return *DF-SZ* to its value of two before any other command.

```
10 POKE 23659,0 : POKE 23689,1
20 PRINT "Press any key" : PAUSE 0
30 POKE 23659,2
```

Different cursors

Sometimes the presence of a flashing *L* or *C* can spoil the look of an input statement. It would be less annoying to have a relevant word as the cursor.

Poking 23617, which is the mode of the cursor, with the relevant number, enables you to choose from all the keywords, numbers, graphics shapes and letters. Most of the numbers from 3 to 130 are graphics cursors in disguise, but the rest contain about half the key-words. Try experimenting, eg:

```
10 POKE 23617,210
20 INPUT FLASH 1;"PRESS 'ENTER' TO ";LINEa$
30 POKE 23617,0
```

To change the colour of the last two lines of the screen, which are the same

colour as the *Border*, can give interesting results. The address of the *Border* colour is 23624:

```
10 POKE 23624,130 : POKE 23617,210
20 INPUT "PRESS ENTER TO ";LINE a$
30 POKE 23617,0
```

You can return the *Border* to normal with a normal *Border* command. Experiment with numbers from 1 to 255 for different colours.

Redefined character set character drawer

There are times when the inability of *Screen\$* to recognise user-definable graphics is inconvenient to say the least. Redefining your character set and storing it in Ram gets around this problem admirably, as demonstrated in *Popular Computing Weekly*, September 30. Unfortunately, if you have a 48K machine the numbers given in this issue will limit you to about 8K to run a program after the computer has taken its bit to run itself.

To find Ramtop, so you can put your character set just below it, type:

```
PRINT PEEK 23730+256*PEEK 23731
```

Subtract 1024 from this and remember it

as *a*. Now to find where to point *Chars* type:

```
10 LET b=INT(a/256) : LET c=a-b*256
20 PRINT c,b
```

These are the numbers you poke into the addresses 23606 and 23607 respectively. To get your character set into Ram type:

```
1 LET a=31575-1 : CLEAR a : LET a=31575
2 LET d=15360 : FOR z=0 TO 1023
3 POKE (a+z), PEEK (d+z) : NEXT z
4 POKE 23606,87 : POKE 23607,123
```

Note: The numbers *a*, *b* and *c* in the above program are for the 16K machine, 48K owners should use the numbers they obtained previously.

For those of you who like to see what you are changing when you redefine your character set, Program 1 gives you an 8x8 grid to move around in and change your characters. For those who wish to *Save* their new character set, be it the Greek alphabet or space invaders, see page 141 of your Sinclair manual. Again the value of *a* given in this program is for use with the 16K machine — 48K owners should use their own value. ■

Program 1. Pokes inverted character set to RAM.

```
10 LET a=31574 : CLEAR a : LET a=31575
15 FOR v=32 TO 128 : LET as=CHR $ v
20 LET b=15360+(8*CODE as)
30 FOR z=0 TO 7
40 POKE (a+z+(8*CODE as)),PEEK (b+z) : NEXT z
50 NEXT v
60 POKE 23606,87 : POKE 23607,123
23
```

Program 2. Grid to draw redefined characters.

```
5 LET a=31575 : LET r=1 : LET c=1
10 IF a<different 'a' for 48K
10 PRINT " "
20 FOR n=1 TO 8 : PRINT " " . . . . .
```

```
... " : INVERSE 1;n
30 NEXT n
35 LET a=0 : INPUT "letter? " : a
40 IF a="" THEN STOP
40 INPUT "row? (1-8) : " : r
45 PRINT AT 16,0;"PRESS "a"
ove along " " " -colour in current
position " " " -move down a line"
50 -new letter"
50 IF r=0 OR r=9 THEN GO TO 40
60 PRINT AT r,c;" "
60 IF INKEYS="C" AND c<8 THEN
LET c=c+1 : PRINT AT r,c-1;" "
60 IF INKEYS="9" THEN PRINT AT
r,c;" " : LET b=8-c : LET s=s+2+b
: PRINT AT r,12;"e" : LET c=c+1
65 IF c>8 THEN GO SUB 110
67 IF INKEYS="5" THEN GO SUB 1
10 RUN
90 IF INKEYS="1" THEN PRINT AT
r,c;" " : GO SUB 110
95 IF r=9 THEN RUN
100 FOR v=1 TO 30 : NEXT v : GO T
O 50
110 POKE a+(CODE as)*8+(r-1)*e :
LET r=r+1
120 LET c=1 : LET e=0 : RETURN
```

CONVERSION NOT SO SIMPLE

Brian Dale of 27 Dimsdale View East, Porthill, Newcastle, Staffordshire, writes:

Q I am thinking of buying a ZX81 and have been advised that a kit version is better than the ready-built model.

A friend has told me that, according to a handout from a computer show, the 1K static Ram can be connected to the Rom address bus instead of the Z80 address bus. The ZX81 then can offer high resolution graphics and use the definable character set as standard. Is this correct?

A This is not correct. The conversion you are suggesting is not that simple, though it is possible. However, full details of the modification would demand more space than this entire page.

The reason you cannot link up the Ram so easily is that the Ram will not be connected to the Rom Cs, it has its own Ram Cs. In essence, you would need to re-locate eight addresses and data line resistors between the Ram databus and the edge connector. It would then need some decoding circuitry which would only bring in the Ram when the character set was called.

SUBTRACTING NUMBERS

Paul Mason of Hanworth, Bracknell, writes:

Q I would like to know how much memory I have left in my Spectrum. I was told that it can be done in the same way as the ZX81, but using different numbers. I know how to determine the memory on my ZX81, but I do not know how it works and I do not know what numbers to use for the Spectrum. Can you help?

A You need to find the address at the start of the program and subtract it from the address at the end. This will give you the number of addresses that your program takes up. As there is one byte to one address, this will give you the length of the program in bytes.

If you turn to page 165 in your manual you will see a memory map. The basic program occupies the space from Prog to Vars — if you subtract Prog from Vars it will give you the length of your program.

However, things are not quite this simple. The amount of space you are using extends beyond the amount contained in the Basic program section. You should at least include the variable so that Prog from E_Line is more useful. If you want to include the working space, then Prog to Stackbot would be better. Chapter 25 of the manual not only gives you the addresses in the system variables that will return these values, but also the correct syntax of PEEKing at them. Try this:

```
10 LET a=PEEK 23641 + 256*
   PEEK (23641 + 1)
(THIS returns the address of E_LINE)
20 PRINT a
30 LET b=PEEK 23635 + 256*
   PEEK (23635 + 1)
(THIS finds the address of PROG)
40 PRINT b
50 PRINT a-b
60 PRINT
70 PRINT a-b
(THIS gives E LINE minus PROG ie,
the number of bytes in the
program)
```

This is useful as a demonstration, but is impractical to enter during programming. It can be reduced to the following line:

```
PRINT (PEEK 23641 + 256 * PEEK
(23641 + 1)) - (PEEK 23635 + 256
* PEEK (23635 + 1))
```

These numbers apply to Prog and E_Line. Change the system variables if you want to find the addresses between other sections of the memory.

RETURNING THE KEY VALUES

J Lee of Hayes, Middlesex, writes:

Q In the ZX81 Rom there is meant to be an address that returns the value of a key being pressed. Could you tell me the equivalent address in the Spectrum's Rom?

A On the Spectrum there is a scan of the keyboard every fiftieth of a second. The

Code of the most recent key pressed will be stored in the system variable Last K, so a Peek at this will give you the last key pressed. The command Peek23560 will return the Code 13, because the last key you would have used would be Enter.

NO, CONNECT UP AS NORMAL

A M Collyer of Montserrat Road, Basingstoke, Hampshire, writes:

Q I want to build my own cartridge mother board for my Vic20. Should the various expansion slots be joined in the normal parallel fashion, or should some other method be used?

A No, you connect up the lines in parallel as normal. It must be remembered that you should not end any of the lines. The usual way is to run the main lines horizontally and tap each of the connectors off vertically.

CONTINUOUS SCROLLING

David Dennis of London Road, Isleworth, writes:

Q I am having problems with the Scroll function on my ZX Spectrum. In the manual it says that if you Poke 23692 with a number greater than one, it will scroll that many times before asking Scroll?. I want the screen to stop after about six scrolls, but it will not. I tried Poking 23692,6 but it only scrolled six lines. When I tried 23692,300 I got an error message.

A This is a bit confusing. If you Poke any number above 10 into 23692 you will get a continuous scroll. As with all addresses, you cannot Poke into it any number greater than 255, so of course you got an error message at your attempt to Poke in 300.

What you have to do is work out the number of lines you want to scroll and then use a variable to control it. Try the following program:

```
10 LET a=10
20 FOR b=1 TO 9
30 PRINT b
40 NEXT b
50 PRINT "*****";a
60 LET a=a + 10
70 IF a> 300 THEN STOP
80 POKE 23692,66
90 GO TO 20
```

The variable a counts the number of lines and stops the program when 300 has been reached. Obviously, you could use this as a sub-routine, within a larger program. I have Poked 23692 with 66, but any number from 10 to 255 will do.

GET A NEW ROM

Simon Spruzen of Heath Lane, Woburn Sands, Milton Keynes, writes:

Q Recently I bought a BBC model B micro. Looking through the manual I came across a detailed list of all the *FX calls, many of which cannot be used with the 0.10 system. This is the system I have in Eprom, or so *FX0 tells me! Where can I get a 1.0 chip for my computer?

A Also, my BBC, unlike many photographs I have seen, does not have a slot near the keyboard for a plug-in Rom cartridge. Do you know why not?

You do not say how recently you purchased the machine. By now, the BBC machines are coming out with the 1.2 Rom. I suggest that you find your nearest BBC dealer and ask him to get you a new Rom.

The 0.10 did not meet the advertised specifications, and should have been replaced — was your computer new or secondhand? I would also suggest that you try not to let the dealer talk you into returning your computer, as it will then go to Acorn which could mean a long wait. Eproms are quite expensive and are worth recovering. Apparently some BBC models have an ordinary Rom and it might be harder to get these replaced.

Some models of the BBC have a plate or cover over the cartridge slot, which might be why you cannot see one on your machine.

Is there anything about your computer you don't understand, and which everyone else seems to take for granted? Whatever your problem Peek it to Ian Beardsmore and every week he will Poke back as many answers as he can. The address is Peek & Poke, PCW, Hobhouse Court, 19 Whitcomb Street, London WC2 7HF.

POPULAR Computing WEEKLY

requires a

Software Editor

We are looking for a full-time **Software Editor**. The ideal candidate will be
aged 21-30 and will have a broad interest in home computers. Evidence of
ability to work to deadlines is important.

The work will involve directing the selection and testing of the programs
published in *Popular Computing Weekly* and helping in the selection of
material for our growing range of books and cassette-based software. This
is a new post which will prove an exciting opportunity for the right
candidate.

Please apply in writing to **Duncan Scot, Managing Editor, Sunshine
Publications Ltd., Hobhouse Court, 19 Whitcomb Street, London
WC2 7HF**, giving full details of your career and experience.

Business Education Ltd

We BUY and SELL

THE WORKING SPECTRUM

A LIBRARY OF PRACTICAL SUBROUTINES AND PROGRAMS

DAVID LAWRENCE

The Working Spectrum

(228 page book)
The first well-documented collection of serious programs for the ZX Spectrum. Programs include a Basic Renumber which can handle Gotos and Gosubs, a character dictionary, a file-handler, several utility programs and a few games. Each program is built up out of re-usable subroutines.

£5.95*

TheWorking Dragon 32

The Working Dragon 32

This is a companion volume to The Working Spectrum and includes several new features such as a Text Editor and a Music Composer and Editor. Other programs help you use the Dragon 32 as an accountant, for more advanced high resolution graphics, as a home tutor for education and for playing games. Each of the programs and subroutines is explained line by line to help develop your own programming skills.

£5.95*

Best of Popular Computing Weekly

Cassette
Four of the top Spectrum and ZX81 games from Popular Computing Weekly are recorded on this one cassette. The games are Laserchase for the 16K & 48K Spectrum, Kong's Revenge for the 16K & 48K Spectrum, Robot Control for the 16K ZX81 and Alien Attack, a Space Invaders type game for the 1K ZX81.

£4.45

Cruising (on Broadway)

cassette
Play Cruising, a new, fast, machine code game of skill for the 16K or 48K ZX Spectrum computer. You won't be able to beat it—the more you practice the faster it gets. Cash prizes are being offered for the highest recorded scores. See Popular Computing Weekly every Thursday for details.

A New Range From Sunshine Books Ltd

Ziggurat

Malthus' law

The Reverend Thomas Malthus created something of a stir in 1798. This was the year he became curate at Albury in Surrey and, more importantly, the year he published his notorious "Essay on the principle of population".

Malthus noticed that, generally speaking, the size of population increased at a geometric rate. If the population doubled in 20 years, then it would double again in the next 20 years. The means of subsistence — the amount of food produced — could not and would not increase at anything like the same rate.

Malthus predicted that, after a short time, the increase in population would outstrip the means available for its support.

What had happened in previous history was that populations had suffered famines and similar catastrophes, and the populations had been kept in check. To depend on famine and pestilence to reduce the size of populations did not appeal to a Christian; and Malthus' ideas were influential in Darwin's thought, as well as those of many social reformers.

The essay was published at a time when fundamental changes were taking place in agricultural methods. The feudal system, in which the vassal rented land from the lord and there was no large-scale integration, was in decline. Instead a system involving the enclosure of large tracts of land was being introduced. The new system was far more efficient, though it did produce some social unrest. The

rapid increase in the efficiency of agriculture, together with the declining need for agricultural labour, helped to provide a firm basis to support the industrial revolution.

These changes meant that the Malthusian predictions were circumvented — he had assumed a constant agricultural technology.

Many commentators now consider that the present state of flux — our computer-led revolution — most closely parallels the agrarian revolution. As with agriculture, as efficiency increases, employment falls, though there may still be growth in output.

As Malthus was writing almost 200 years ago, he perhaps would not have been able to comprehend the extent to which the population has grown.

By about 1844 a vast rail network existed, and had revolutionised society. Yet it was in that year that Frederick Engels wrote of "The condition of the working class in England".

The problem we now have to face is that, while technology has made large populations possible, now large populations make technology indispensable (see J W Krutch, *Human Nature and the Human Condition*, 1959).

Malthus was correct. Even now, with the massive agricultural surpluses in Europe, millions in the world are starving.

Margaret Thatcher, in her speech at the IT'82 Conference, imagined a scene in which you were able, at home, to book your summer holiday by an interactive cable network — even down to seeing videos of the places you might visit. As someone else noted, later in the day, at the moment holiday firms are having trouble selling holidays to anybody at any price. For firms to succeed, they need customers, and the best customers are not the unemployed.

If the undeveloped world cannot feed itself how can we sell to it? If, as seems likely, the new technologies mean that the number of hours worked is reduced dramatically, we need to consider non-work. If we must have the "haves" and the "have-nots", we need to make sure that the "have-nots" have enough.

Boris Allan

Puzzle

Message code

1		2	3
		4	
		5	
6			

Puzzle No 40

ACROSS: 2. B; 4. A + B; 5. A + 7; 6. A².

DOWN: 1. A² - AB; 2. A² + B²; 3. (A - 4)².

Solution to Puzzle No 35

The message was: "Seasons greetings and a Happy New Year from everyone at *Popular Computing Weekly*".

The clues in the question were 'leap' and 'Christmas Day'. This is not a transposition code with letter substitution, but, the code can be 'cracked' by 'leaping' from one letter to the next — the correct leap being 25 Christmas Day = 25).

In the program, the code is entered into the string AS, and the number of steps to be jumped is input in Line 30. As each letter is used it is crossed off and not counted next time round.

```
10 LET AS = " [enter code message] "; 20 PRINT
"ENTER JUMP REQUIRED"; 30 INPUT M; 40 LET
C = 0; 45 CLS; 50 FOR N = 1 TO M; 60 LET C = C
+ 1; 70 IF C > LEN AS THEN LET C = 1; 80 NEXT N;
90 PRINT AS(C); 100 LET AS = AS(TO C-1) +
AS(C+1 TO); 110 LET C = C - 1; 120 IF AS = ""
THEN GOTO 200; 130 GOTO 50; 200 PAUSE 4000;
210 CLS; 220 GOTO 20
```

Winner of Puzzle No 35

Not one single correct entry this week — excess of alcohol and Christmas pudding must have taken their toll!
